REVISION 47, Feb 02/22

ISSUE Feb 02/22

TRANSMITTAL LETTER A320 FAMILY MPD, REVISION 47, FEB 02/22

1. INSTRUCTIONS

This revision replaces A320 FAMILY MPD Revision 46, Issue 00, OCT 14/19.

2. REASON FOR REVISION

- This revision of the MPD was established to reflect changes from:
  - A320 FAMILY MRBR (Maintenance Review Board Report) Revision 25,
  - A320 FAMILY ALS Part 2 (ALI) Revision 09 (including variations released since Revision 08),
  - A320 FAMILY ALS Part 3 (CMR) Revision 08 (including variations released since Revision 07),
  - A320 FAMILY ALS Part 4 (SEMR) Revision 08 (including variations released since Revision 07),
  - A320 FAMILY ETOPS CMP Document Revision 26.
- Implementation of RSC marker for Removable Structural Components
  Removable Structural Components (RSC) – such as doors, flaps, slats – may be transferred between aircraft, resulting in a different utilisation profile than the airframe on which they were originally installed.
  The life monitoring and control of these structural parts and their instructions for continuing airworthiness is a need, especially when RSCs have been removed from the first aircraft on which they were installed. It ensures that these parts meet their associated mandated requirements and limitations, and ensures safe operation.
  As the world fleet of aircraft grows and ages, movements of RSCs are increasing. The industry has recognized that more focus on the traceability of RSCs on and off the aircraft must be brought to the attention of operators, MROs (Maintenance, Repair and Overhaul organisations), suppliers and manufacturers to satisfy continuing airworthiness.
  The responsibility for the necessary RSC control and tracking is incumbent on the airline, and to this end ATA Spec 120 was recently published to provide guidance to operators.
  Following the ATA Spec 120 issuance, the RSC subject has been at the agenda of several Airbus structure task groups, regional seminars and symposiums. Airbus was requested and committed to introduce a new RSC marker in the Maintenance Programme Document that would support Operators for identifying those tasks related to a RSC.
  Due to technical reasons, RSC markers are not reflected in the .pdf Version of the MPD
- Low Utilisation Recommendation (LUR) values review.
- Corrections identified since previous MPD revision.
- Task man-hours review.
- Task preparation review (including preparation MH).
- Task access review (including access MH).
- AMM references added and update.
- MOD SB review for MPD applicability expressions.

3. HIGHLIGHTS OF CHANGES

- MPD task changes from Revision 46 to 47 are highlighted and explained in a separate column (Reason/Justification):
  - in PDF/Excel format in the "SOC"
  NOTE: if the changes in the task are fully in line with the last Revision Information file issue where the task was changed, the issue number of the Revision Information file, whereby the change was released is mentioned in a separate column (only in Excel format). In consequence, if all Revision information file issues were implemented, no further changes required for those tasks.
  - in AirN@v/Planning in the "Highlights"
- GENERAL INTRODUCTION:
  - IMPLEMENTATION AND ACCOMPLISHMENT OF NEW / REVISED TASKS: *GUIDANCE ACCORDING TO SOURCE OF MPD TASK* reviewed.
  - INTERVAL/THRESHOLD CONVENTIONS: Parameters of typical A check changed in acc. with PPH.
  - MAINTENANCE CLOCK STARTING POINT: *General Rule; Specific guidance* reviewed.
  - PERMITTED VARIATIONS TO MAINTENANCE PERIODS: *GENERAL* reviewed.
  - TASK DATA DESCRIPTION: Introduction of RSC marker.
- APPENDIX 3 - CUSTOMIZABLE EQUIPMENT (CE):
  - Document updated (data based on the Appendix 10 of the MRBR)
- APPENDIX 7 - LDG OVERHAUL PROCEDURES DOC:
  - Document updated

4. IMPORTANT NOTE

- MPD SIMPLIFICATION:
  The operator should be aware of manufacturer and vendor recommendations and/or requirements published through Inspection Service Bulletin (ISB), In-Service Information (ISI), Service Information Letter (SIL), All Operators Letter (AOL), Alert Operators Transmission (AOT) and similar documents dealing with scheduled maintenance. These are no longer reflected in the MPD and it is thus the operator's responsibility to review these and determine whether or not to include them in their locally approved programs.
  The simplified MPD concept retains some Engine Manufacturer VSB related tasks from Rev 43. Since these have not been addressed by Airbus source documents, further assessment will be made to determine whether any should be given ICA status (and included in the MRB Report) before they are removed.
- Information from new or revised source documents, which have been received after closure of MPD authoring will be considered with next MPD Revision.
- Scheduled Maintenance Requirements documentation (i.e.: MRBR, ALS Parts, MPD, ETOPS/LROPS documents, EWIS Instructions for Continued Airworthiness (ICAs) & Scheduled AMM) are available on AirbusWorld.
  The way to access the documentations on new AirbusWorld is as follows:
  > New AirbusWorld/Home
  > Content library
  > Maintenance and Engineering
  > Scheduled Maintenance Requirements
  > Select the dedicated document (ALS Part X, MRBR, MPD Information, etc.)
  NOTE: The A/C type can be filtered in the upper part of the screen.
- For MPD Revision Information (RI) follow the way above and select the "A320FAM MPD Revision Information" file.
- For some MPD tasks, an AMM procedure could not be referenced. The AMM procedures were not available at the time of the MPD compilation. An updated "Scheduled AMM tasks incorporation date" file is uploaded to AirbusWorld. Follow the way above and select the "Scheduled AMM tasks incorporation date".
  NOTE: Please contact the AMM department's via TechRequest (domain: Technical Manuals), if you urgently need an AMM procedure.
- If you would like to contact Airbus regarding questions/remarks, please use TechRequest via AirbusWorld.

SUMMARY OF CHANGES

MPD SEC	TASK NUMBER	MVT	DESCRIPTION	REASON / JUSTIFICATION
2-21	213100-02-1	R	TASK NOTE "PLANNING: FOR 1ST REALIZATION OF CMR 213100-00002-1-C ON AIRCRAFT, CREDIT CAN BE TAKEN FROM LAST ACCOMPLISHMENT OF MPD 213100-02-1." ADDED IN SOURCE: "CMR*" ADDED IN SOURCEREFERENCE: "(CMR*) CMR 213100-00002-1-C" ADDED	CMR VARIATION 7.1; CMR REV.08
2-21	213100-05-1	R	TASK NOTE CHANGED FROM: "THE FUNCTIONAL CHECK MAY ALTERNATIVELY BE ACCOMPLISHED AS AN OFF AIRCRAFT TASK. GENERAL INTRODUCTION

1. SCOPE, VALIDITY AND LIMITATIONS

A. GENERAL

The Maintenance Planning Document (MPD) is an AIRBUS envelope repository document containing repetitive maintenance tasks published in the Maintenance Review Board Report (MRBR), the Airworthiness Limitation Section (ALS) Parts 2, 3, 4 and 5 and the ETOPS CMP documents and provides additional information about maintenance tasks, their scheduling and procedures.

It may be used by operators to develop their locally approved scheduled maintenance programs.

All MRBR and ALS tasks are declared as Instructions for Continued Airworthiness (ICA) and when applicable to the aircraft configuration should be included in the operator's initial maintenance program.

MRBR tasks and intervals constitute an initial minimum set of requirements for inclusion in a maintenance program at aircraft entry into service with the operator. The analysis of feedback from service may subsequently justify changes to these requirements in order to maintain program effectiveness.

Development of the MPD is part of the Scheduled Maintenance Process, itself identified in the Airbus DOA (Design Organisation Approval) and is audited on a regular basis in the frame of the Airbus Quality Assurance System. As such, the MPD complies with the content of several approved source documents.

NOTE: Compliance with the MPD does not automatically imply compliance with the minimum set of scheduled maintenance requirements that shall be observed. Especially for mandated requirements originating from ADs and ALS Parts, operators are advised to check independently from the information in the MPD, that these requirements are covered by their Maintenance Program.

B. COVERAGE

This A320 FAMILY MPD Revision contains tasks from the following source documents:

- Maintenance Review Board Report (MRBR), Revision 25
- ALS Part 2: Damage Tolerant Airworthiness Limitation Items (DT-ALI) Revision 09
- ALS Part 3: Certification Maintenance Requirements (CMR) Revision 08
- ALS Part 4: System Equipment Maintenance Requirements (SEMR), Revision 08
- ALS Part 5: Fuel Airworthiness Limitations (FAL), Revision 07
- ETOPS Configuration, Maintenance and Procedures (CMP) Document, Revision 26

NOTE: Maintenance requirements promulgated through ALS Part 1, ALS Part 2 (Section 4), ALS Part 4 (Section 3 and 4.2) and ALS Part 5 (Section 3 and 5) are not included in MPD since they are not repetitive maintenance tasks or have a threshold beyond the MPPT (ALS Part 2). However these mandatory requirements approved by Primary Type Certification Authorities shall be addressed by Operators Maintenance Programs.

NOTE: The simplified MPD concept retains some Engine Manufacturer VSB related tasks from Rev 43. Since these have not been addressed by Airbus source documents, further assessment will be made to determine whether any should be given ICA status (and included in the MRB Report) before they are removed.

The information and instructions contained in this MPD are applicable to the following models:

- A318-110 (with CFM56-5 engines).
- A318-120 (with PW6000A engines).
- A319-110 (with CFM56-5 engines).
- A319-130 (with IAE V2500 engines).
- A319-150N (with CFM LEAP-1A engines).
- A319-170N (with PW1100G-JM engines).
- A320-210 (with CFM56-5 engines).
- A320-230 (with IAE V2500 engines).
- A320-250N (with CFM LEAP-1A engines).
- A320-270N (with PW1100G-JM engines).
- A321-110 (with CFM56-5 engines).
- A321-130 (with IAE V2500 engines).
- A321-210 (with CFM56-5 engines).
- A321-230 (with IAE V2500 engines).
- A321-250N (with CFM LEAP-1A engines).
- A321-250NX (with CFM LEAP-1A engines).
- A321-270N (with PW1100G-JM engines).
- A321-270NX (with PW1100G-JM engines).

A319-150N, A319-170N, A320-250N, A320-270N, A321-250N and A321-270N are aircraft with NEO configuration. NEO refers to New Engine Option.

A321-250NX and A321-270NX are A321 NEO aircraft in Airbus Cabin Flex configuration ("FLEX"). FLEX refers to a configuration that introduces the potential for an increased passenger capacity achieved by a new door layout and improved cabin flexibility.

Included in this MPD are maintenance tasks for the following Auxiliary Power Units (APU):

- Honeywell (formerly GARRETT) GTCP 36-300
- Honeywell (formerly ALLIED SIGNAL) 131-9(A)
- APIC APS 3200

C. SCOPE/LIMITS OF THE MPD SOURCE DOCUMENTS

The information and instructions included herein are only applicable to parts installed through an Airbus modification / service bulletin and are not intended to cover parts installed through a Supplemental Type Certificate (STC).

The tasks and frequencies in this MPD have been developed and are valid for aircraft in operation. If an aircraft is not in operation e.g. parked or stored, the instructions quoted in AMM chapter 10 should be followed.

Maintenance requirements promulgated through ALS Part 1 and ALS Part 4 (except Section 4) are not included in MPD since they are not repetitive maintenance tasks. However these mandatory requirements approved by Primary Type Certification Authorities shall be addressed by Operators Maintenance Programs.

The tasks in this MPD are based on various source documents, each having its own scope/limits.

- Maintenance Review Board Report (MRBR) tasks:
  The A320FAMILY MRB Report is based on an aircraft utilization of between 1800 FH to 5000 FH or from 1000 FC to 3000 FC within a 12 month period. Operators whose aircraft utilization differs from these parameters may need to make adjustments to their customized scheduled maintenance program together with their regulatory authority.

– ALS Part 2: Damage Tolerant Airworthiness Limitation Items (DT-ALI) tasks:
  The airworthiness limitations from ALS Part 2 allow operation up to the Limit of Validity (LOV) in FC or FH whichever occurs first. Refer to the introduction of the ALS Part 2 (ALI).
– ALS Part 3: Certification Maintenance Requirements (CMR) tasks:
  The CMR limitations are in consideration of a maximum number of Flight Hours (FH)/Flight Cycles (FC) that may be accrued by an individual aircraft. Refer to the introduction of the ALS Part 3 (CMR).

Low Utilization Recommendation (LUR):

The MPD provides additional calendar time interval values called "Low Utilization Recommendation" (LUR) in order to allow operator's aircraft utilization below the range stated in the MRBR. For each MPD task, where a calendar time value has been added for this purpose, an additional "LUR" marker is provided in the source column.

The LUR calendar intervals are not derived from the MRB Process and hence have not been subject to MRB approval. They are typically calculated considering the lower utilization assumptions in the MRBR (1800 FH / 1000 FC) and should be considered as an Airbus recommendation.

Operators whose utilization is within the MRBR envelope values do not need to add LUR driven additional calendar time intervals to their individual scheduled maintenance program.

Optimization of Calendar Time Check Intervals for Aircraft with Low Utilization:

Customers flying aircraft under corporate jet operations with low utilization of the aircraft can take benefit from a specific study managed by Airbus Maintenance Programs Engineering department. This analysis supports increase of several tasks intervals from 4 MO to 6 MO. These specific recommendations are reflected in Airbus customized letter "A320 FAMILY Maintenance Program – Optimization of Calendar Time Check Intervals for Aircraft with Low Utilization" that is available on demand. Any corporate jet operators which want to take the advantage from this optimization analysis are invited to contact Airbus for further advice via TechRequest.

Aircraft with utilization above the upper MRBR values are covered by the contents of the MPD as well. No additional interval parameters have been identified for this.

Lightning / High Intensity Radiated Fields (HIRF):

Post certification, the Type Certification authorities requested Airbus to ensure that the Lightning / High Intensity Radiated Fields (HIRF) protection of critical systems installed in the A320 FAMILY is adequately addressed in the operators maintenance program. The manufacturer identified an appropriate method by which to confirm that in-service operation will not reduce this protection to a level that is inadequate to maintain Type Certification objectives. Though the specific HIRF / Lightning related scheduled tasks are identified in an Appendix to the MRB Report, operators should consider them as MRBR tasks and include them in their approved maintenance programs. The specific HIRF / Lightning related scheduled tasks have been added to the Systems section of the MPD under ATA 20.

2. REVISIONS

The A320 FAMILY MPD is revised to reflect:

- Revision of source documents
- Updated AMM procedure references
- Updates of data not contained in the source documents

MPD Revisions are launched to reflect revisions to the ALS and/or MRBR such that, as far as possible, publication of impacted documents is synchronized.

Data control instructions for each MPD revision are provided in the Summary Of Changes (SOC). Prior to incorporating a revision, the operator shall ensure that the previous revision has been incorporated.

In between MPD Revisions, updates of the MPD, called “MPD Revision Information” are available on AirbusWorld in the following location:

- AirbusWorld > Content library > Maintenance and Engineering > Scheduled Maintenance Requirements > MPD Information

For detailed information refer to the introduction of the MPD Revision Information.

3. IMPLEMENTATION AND ACCOMPLISHMENT OF NEW / REVISED TASKS

A. GENERAL

Instructions for the introduction of new or revised recommendations into an existing maintenance program are typically established by the operator's National Aviation Authority.

This paragraph is included in the MPD to provide guidance to an operator who may not have locally approved instructions concerning:

- how to introduce new or modified tasks into an existing maintenance program, or
- how to schedule the accomplishment of such tasks on aircraft for which the recommendation is, or soon will be, overdue.

It is not intended that operators seek to change existing NAA instructions based on these recommendations.

B. DEFINITIONS

The terms that describe the time periods associated with introduction of new recommendations are not always clearly defined in regulatory documentation and are not necessarily harmonised between different countries. For the purposes of the Airbus MPD guidance material the following definitions are used:

1. Implementation Period:
   The period of time between the publication date (or, if quoted, the effective date) of a new or revised recommendation in a source document and the introduction of that recommendation in the operator's approved maintenance program.
2. Compliance Time:
   The period of time given to operators to accomplish maintenance tasks and/or replace items (at component or aircraft level) having exceeded, or close to exceed, the new or reduced interval provided in the source document.

C. GUIDANCE ACCORDING TO SOURCE OF MPD TASK

Unless advised otherwise in the transmittal details, new and revised requirements should be implemented into the operator's maintenance program within 12 months of the publication date, as far as is practicable.

The following paragraphs address Compliance Time for tasks originating from the various MPD source documents.

1. Damage Tolerant - Airworthiness Limitations Items (DT-ALIs) – ALS Part 2
   Airbus target publication of DT-ALIs at least two years before they become due on the first aircraft. In cases where this two year period is not achieved, it is recognized that it may be difficult (or impossible) to schedule the task on a particular airframe before it comes due. In such cases, Airbus will review the particular utilization and type of operation to determine if an alternate means of compliance can be developed.
   Airbus is not normally able to issue a generic compliance time for DT-ALIs. DT-ALI compliance periods must be handled on a case by case basis, using specific utilization data from concerned aircraft. Operators should ensure they do not exceed the limitation without prior agreement with the manufacturer, the local airworthiness authority and the certificating authority. In exceptional circumstances a DT-ALI may be issued which is already overdue or close to be overdue on a particular aircraft. In such cases the ALS Part 2 transmittal details will advise an appropriate compliance time for first time accomplishment on aircraft where the task is already overdue or will become overdue within the quoted threshold / interval. Operators may also contact Airbus for specific advice.

2. Certification Maintenance Requirements (CMRs) – ALS Part 3
   New requirements in ALS Part 3 revisions should only result from the certification of design changes and thus are normally published before the subject design feature enters service. If for any reason a CMR becomes valid on a design configuration already in service then the ALS Part 3 transmittal details will advise an appropriate compliance time for first time accomplishment on aircraft where the task is already overdue or will become overdue within the quoted threshold / interval.

3. System Equipment Maintenance Requirements (SEMR) – ALS Part 4
   The ALS Part 4 transmittal details will advise an appropriate compliance time for first time accomplishment on aircraft where the task is already overdue or will become overdue within the quoted threshold / interval.

4. Fuel Airworthiness Limitation Items (FAL) – ALS Part 5
   The ALS Part 5 transmittal details will advise an appropriate compliance time for first time accomplishment on aircraft where the task is already overdue or will become overdue within the quoted threshold / interval.

5. MRB Report and MRB Report Temporary Revision (TR)
   MRB Report (MRBR) tasks arise from a theoretical analysis of the aircraft prior to entry into service. Tasks from the Systems and Powerplant Section are categorized according to whether they are associated with hidden or evident conditions and according to their contribution to the avoidance of safety and non-safety related failure effects. These categories (Failure Effect Categories – FECs) give an idea of 'importance' or 'criticality' (FEC 5, 8, 9, 6 and 7 in decreasing order of importance) and allow a different compliance time policy to be established for different categories.
   The MRBR is a report containing the initial minimum scheduled maintenance/inspection requirements for derivative or newly type certificated transport category aircraft. Operators of the aircraft type should implement the MRBR or revisions thereto, in accordance with established procedures. It should be noted that the MRBR is not the aircraft maintenance program but does provide the initial basis for such a program. Depending on an operator's capabilities and overall maintenance experience, adjustments to initial maintenance program tasks and intervals may be approved by the operator's National Aviation Authority.
   National regulations vary as to how an operator controls his program after entry into service. Typically, a Reliability Control Program (RCP) will be developed that will identify changes necessary to maintain an acceptable level of continued airworthiness, operational capability and economic operation. Some operators may move off the MRBR and rely entirely on their RCP together with Airworthiness Directives, the ALS amendments and, sometimes, Service Bulletins.
   According to NAA regulations, operators are typically required to assess all new recommendations made in revisions to MRB Reports. Though Airbus expects operators to reflect all applicable tasks in their programs there is no requirement for this and an operator may have justification to substantiate that the task is not effective in their operation.
   When a new requirement is identified for inclusion in the Maintenance Program, the operator will normally use engineering judgment to determine when the task should be accomplished for the first time, or when a revised task should be next applied after an interval change. The reason for the revised requirement will normally be evident and thus an assessment of the relative risk and impact caused by delayed accomplishment can be made.
   In the absence of locally agreed policy, Airbus suggests the following guidelines:
   – For Systems/APU/Powerplant tasks, non-ALI and non-CPCP related Structure tasks and ZIP tasks
   For new or revised task requirements that are already overdue or will become overdue within the quoted threshold / interval, perform the task in the next scheduled check package when the aircraft is on ground long enough to accomplish the task and any necessary corrective actions.

This might not be the next check (for which the planning may be completed) but it would be expected in the following one if ground time is appropriate.
If task elapsed time is short and any possible corrective action is easily addressed, operators should consider first performance of at least the FEC 5 and 8 tasks at the next convenient block A-check (or equivalent) or during the next check opportunity if an equalised program is used.
Unless stated otherwise in information provided at time of MRB Report / Temporary Revision publication, if the required access is not normally scheduled until the intermediate (6 YE) or heavy maintenance check (12 YE), e.g. tasks requiring fuel tank entry or galley / lavatory removal, Airbus recommends accomplishment no later than the next due interval. Overdue FEC 5 & 8 tasks should be accomplished no later than the next intermediate (6 YE) maintenance check.

– For CPCP related tasks

A new or revised CPCP requirement is normally associated with corrosion findings. In the case where the task is overdue or will be within the due interval, the operator needs to consider his local operating conditions in order to assess the potential for corrosion in this area on his particular aircraft. It is recommended to perform the task as soon as possible on at least one aircraft in the fleet in order to help make this assessment. Delay in accomplishment may lead to higher repair costs but not a loss of continued airworthiness. Note that if a safety concern exists, a new CPCP task recommendation on an in-service aircraft would be promulgated by ISB (and possibly AD) in addition to inclusion in the MRB Report.

– For ATA 20 tasks related to EWIS or L/HIRF

For new or revised task requirements that are already overdue, or will become overdue within the quoted threshold / interval, perform the task at the operator's next convenient hangar maintenance opportunity (typically C-check or equivalent) unless access is assessed as insufficient to perform the task without exceeding the scheduled out-of-service period. If that is the case, the task should be performed at the next access opportunity (e.g. at the intermediate (6 YE) or heavy maintenance check (12 YE)) but not exceeding the task interval counting from publication of the requirement.

6. Fatigue Monitoring Program (FMP)

For a new or revised FMP requirement that is already overdue for a particular aircraft, the performance of the new task should be planned at the next Heavy Maintenance Visit (HMV) of that aircraft (multiple of 6 YE or equivalent operator's HMV (e.g. 84 MO) approved by their NAA).
If the time between publication of the new FMP requirement and the next HMV for an aircraft is considered insufficient in consideration of the time required for implementation in the operator's maintenance program and the check planning, the subsequent HMV can be selected for the first application of the new FMP requirement.
Example: An aircraft is 17 YE old when a new 12 YE FMP inspection requirement is published. If it is not feasible that the FMP inspection requirement can be performed during the upcoming 18 YE HMV, the FMP inspection requirement should be performed during the subsequent HMV (24 YE equivalent HMV).
Airbus recommends to perform all FMP inspection requirements in the frame of the Heavy Maintenance Visit (HMV).
For NOTE A FMP tasks:
In the case an aircraft in an operator's fleet reaches the repeat interval (e.g. 18 YE) before the initial threshold (e.g.12 YE) has been adjusted, then the FMP inspection should still be accomplished at the repeat interval for that particular aircraft. This repeat accomplishment would not count twice towards the contribution of the FMP requirement fulfilment for the initial threshold inspection (e.g. 12 YE), but would count once towards the contribution for the initial threshold (e.g. 12 YE) and once towards the adjusted threshold (e.g. 18 YE).
For NOTE B FMP tasks:
In the case an operator has already accomplished 10 or more inspections at or above the ALS Part 2 Threshold, the NOTE B FMP task can be deleted from its maintenance program.

4. INTERVAL/THRESHOLD CONVENTIONS

A. GENERAL

All task intervals are expressed in terms of usage parameters, i.e. FH, FC or calendar time . The most appropriate interval has been selected for every task.

Operators typically group maintenance tasks and perform them during a check event. Typical events are light checks e.g. “A-check” and base checks e.g. “C-check”.

The appropriate task packaging mainly depends on aircraft utilization and operators policies. Operators typically perform light checks every 1000 FH or 1000 FC or 6 MO (whatever comes first) because majority of light check tasks have one or a combination of the above intervals (and multiples).

Operators who apply the block concept may perform base checks every 36 MO or 12000 FH or 8000 FC (whatever comes first) because a high number of tasks typically performed during base checks have one or a combination of the above intervals (and multiples). Tasks that become due before the scheduled maintenance event (e.g. task with interval 24 MO, 8000 FH) need to be performed at an earlier opportunity earlier e. g. during a light check (e.g. A-check event).

STRUCTURES SECTION

For the Structures section the threshold and interval for environmental deterioration related items is expressed in calendar time and typically 6 YE and multiples.

Thresholds and intervals for fatigue damage related items are given in Flight Cycles (and Flight Hours for range sensitive items).

ZONAL SECTION

All task intervals are expressed in calendar time.

Credit may be taken from previous A318, A319, A320 or A321 operational experience.

The MPD is not intended to give the total maintenance program. There are items which are typically performed by each operator more frequent than 1000 FH / 1000 FC / 6 MO. The routine content of checks occurring more frequent than the 1000 FH / 1000 FC / 6 MO shall be developed by the operator and approved/accepted by its local Regulatory Authority.

Maintenance/inspection tasks with intervals more frequent than 1000 FH / 1000 FC / 6 MO found in this MPD were developed through the MSG-3 analysis process.

B. INTERVAL/THRESHOLD PARAMETERS

The following interval parameters are used in this MPD:

Operational units (usage parameters)

– "FH" (Flight hours) : Elapsed time between wheel lift off and touchdown.

– "FC" (Flight cycle) : A complete take off and landing sequence.

Calendar units

– "HR" (Hours) : One Calendar hour elapsed.

– "DY" (Day)	:	24 Calendar hours elapsed. “DY” interval may be counted from 00:00 o'clock of next day (has not to include remaining day time since task completion).
– "MO" (Month)	:	One Calendar month (can be calculated as 1/12 calendar year). E.g.: Task with 9 MO interval is performed 12 July 2014. The next due date is then 11 April 2015 23:59.
–“YE" (Year)	:	One Calendar year (can be calculated as 365.25 days). E.g.: Task with 6YE interval is performed 12 July 2014. The next due date is then 11 July 2020 23:59.

Other codes

- “CE" (Customizable Equipment)
  Consult the vendor's documentation for this interval/threshold.
- "NOTE"
  Refer to the note in the task description.

C. GENERAL INTERVAL/THRESHOLD RULES

- When intervals or thresholds with different units (parameters) are assigned to a task, the interval/threshold expiring first shall apply, if not otherwise stated.
- Task interval parameters expressed in this MPD may be converted to an individual operator's desired unit (flight hours, cycles or calender time), provided this conversion does not result in the operator exceeding the initial requirements reflected in the MPD.
- The thresholds and intervals quoted in calendar time in this document include aircraft time in and out of service.
  In other words, operators will not, in general, be allowed to take credit for time out of service or storage periods to extend calendar inspection thresholds/intervals. Exceptions to this can be considered by Airbus Maintenance Engineering but will depend on variables such as time duration, aircraft age, environment and where aircraft was in maintenance cycle.
  Specific advice can be given by Airbus Maintenance Engineering on a case-by-case basis if relevant aircraft details are provided.
- Intervals of tasks with source “MRBR” may be changed in accordance with operator's Regulatory Authority practices and rules. In this respect, attention is drawn to the task origin and the following:
  - for Systems and Powerplant tasks, to the Failure Effect Category (FEC) noted in Section C of MRBR and reflected in “SOURCE” column of this MPD.
  - for Zonal tasks, to the frequency of the General Visual Inspection or Visual check tasks transferred from Structures or Systems and Powerplants.
  - for ATA chapter 20 not to delete tasks with the identifier “EWIS” or L/HIRF from the operator's maintenance program.

5. MAINTENANCE CLOCK STARTING POINT

Unless otherwise specified by AIRBUS in the documentation of an aircraft at time of first delivery, the starting point for calculation of the due dates or times of all aircraft maintenance tasks is identified in the following paragraphs.

The **Transfer of Title** (ToT) is when conformity and contractual documentation is handed over and the Certificate of Acceptance is signed, this identifying the official transfer of ownership to the first buyer. In the absence of the date of ToT, an operator may refer to the 'Delivery Date' as recorded in the In-Service Data 'Aircraft History' file available on Airbus|World.

A. General Rule

The date of first ToT may be used as the starting point for the following:

- Systems / Power Plant tasks with intervals expressed in airframe FH, FC or Calendar Time (except as identified in paragraph B)
- Structure tasks with an interval quoted in Calendar Time
- Zonal tasks

Note: This may not be valid if the first ToT occurs more than 90 Days after 1st Flight. In this situation specific guidance on when the clock starts may be given to the operator at time of delivery. If no record exists that this information was provided, or if details are not available, then with the exception with the Landing Gear TBO, any task that has not yet been accomplished shall be conservatively planned with reference to first flight date plus 90 days.

Exceptionally, for the Landing Gear TBO, provided the time between 1st Flight and ToT does not exceed 180 Days, the ToT can be used as the starting point for Landing Gear TBO calculations.

For aircraft where at the time of first delivery the time between 1st Flight and ToT exceeds 180 Days, the date of the 1st Flight plus 180 Days can be used as a start date for the Landing Gear TBO calculation.

In summary, the calculation date (starting point for calculation) for the first Landing Gear TBO will be the date of the 1st Flight plus 180 Days or the ToT WHICHEVER OCCURS FIRST.

First flight shall be used for all structure tasks with an interval quoted in FH, FC or LDGS.

Tasks with intervals quoted in terms of component FH or component FC (e.g. APU Hours, Engine Cycles, ACT FH) shall be counted from First Flight of the component.

Note: For tasks with thresholds/intervals expressed in multiple parameters, the due date is the earliest determined in consideration of the clock starting point for each parameter considered individually. E.g. a structure task with threshold 12 YE or 30000FC or 60000FH shall be performed within 12 YE of first Transfer of Title or 30000FC of first flight or 60000FH of first flight, whichever is reached first.

For repeat maintenance tasks, the interval is counted from the time the maintenance task was previously performed.

The time to start the clock for Systems & Power Plant and Zonal tasks with applicability determined by post-delivery modification embodiment is the date of embodiment. For Structure tasks with applicability determined by post-delivery modification embodiment, refer to dedicated notes in the section introduction or the task description for determination of clock starting time.

B. Specific guidance

- **For ALS Part 2 (DT-ALI) tasks:**
  - The threshold is the time at which the task is first due.

- Threshold limitations quoted in FC or FH count from first flight.
- Threshold limitations quoted in Calendar Time may be counted from the Transfer of Title to the first operator.
- In the event that the first task is accomplished very early, such that the period (Calendar time, FC, FH) between initial task accomplishment and the threshold is greater than the interval, the next task can be performed at the threshold (rather than the repeat interval).
- When alternative inspection methods are provided, the next interval applicable is the one associated with the inspection method used at the previous inspection.
- "Touch and Go" cycles can be neglected if they are less than 5% of the total number of Flight Cycles up to threshold inspection or between two consecutive inspections. Each "Touch and Go" cycle above 5% is to be counted as one Flight Cycle, up to threshold inspection or between two consecutive inspections.

- **For ALS Part 3 (CMR) tasks:**
  - Limitations quoted in FH or Calendar Time may be counted from the Transfer of Title to the first Operator. This policy is agreed with EASA in consideration of the very low number of FH performed between first flight and delivery, and the methodology used to define the value of CMR task limitations.
  - Limitations quoted in FC count from first flight.

- **For ALS Part 4 (SEMR) tasks:**
  - Limitations controlled at aircraft level and quoted in Calendar Time count from the Transfer of Title to the first operator
  - Limitations controlled at aircraft level and quoted in FH, FC or LDGS count from first flight.
  - Limitations controlled at component/subassembly level and quoted in Calendar Time, FH, FC or LDGS count from the date at which the component/item accomplishes the first flight for which it will undertake its intended function.

- **For ALS Part 5 (FAL) tasks:**
  - Limitations quoted in FH or Calendar Time may be counted from the Transfer of Title to the first Operator. This policy is agreed with EASA in consideration of the very low number of FH performed between first flight and delivery, and the methodology used to define the value of FAL task limitations.
  - Limitations quoted in FC count from first flight.

- **For an overhauled landing gear or a new landing gear installed after first Transfer of Title:** the start date for Calendar Time tasks is the date of the gear's first flight after installation. If this first flight takes place more than 90 days after installation contact Airbus Maintenance Programs Engineering using TechRequest. For the original LDG, paragraph 'A. General Rule' applies

- **For equipment having intervals either:**
  - defined by the vendor (CE) or by National Requirements (NR), or
  - annotated with a NOTE that requires the task to be managed according to component service history, the starting point is the date of manufacture or date of previous task accomplishment on the component (for Calendar Time tasks) or the first flight for which it will undertake its intended function (for FH and FC tasks) unless otherwise stated by vendor or National Authority.

  If the date of manufacture refers only to the month then, for the purposes of scheduled maintenance planning, the subsequent maintenance actions can be scheduled with reference to the last day of that month.

  For components addressed by Airworthiness Directive (AD): as stated in the AD.

- Summary:

Source		Calendar Time	Flight Hours	Flight Cycles or Landings
MRBR	SYSTEM	ToT	ToT	ToT
	STRUCTURE	ToT	1st Flight	1st Flight
	ZONAL	ToT	ToT	ToT
ALS	Part 1 (Life Limitations)	1st Flight	1st Flight	1st Flight
	Part 2	ToT	1st Flight	1st Flight
	Part 3	ToT	ToT	1st Flight
	Part 4 (aircraft level)	ToT	1st Flight	1st Flight
	Part 4 (component level)	1st Flight	1st Flight	1st Flight
	Part 5 section 3 (Life Limitations)	1st Flight	1st Flight	1st Flight
	Part 5 section 4	ToT	ToT	1st Flight
New or overhauled LDG installed after first ToT.		1st Flight after installation*	N/A	1st Flight after installation
NR, CE or Note requiring task to be managed according to component service history		Date of Manufacture or date of previous task accomplishment on the component**	Date of Manufacture or date of previous task accomplishment on the component**	Date of Manufacture or date of previous task accomplishment on the component**
* Contact Airbus if first flight takes place more than 90 days after installation ** Unless otherwise stated in vendor or National Authority documentation				

6. INTERVAL ESCALATION

A. MRBR tasks

The individual task intervals shown in this MRBR may be adjusted with approval from the operator's appropriate Regulatory Authority. If a task is escalated, it must be based on satisfactory substantiation by the operator and review and approval by its appropriate Regulatory Authority, or in accordance with the operator's Reliability Program which has been approved by the appropriate Regulatory Authority. However, tasks with Failure Effect Category (FEC) 5 and 8 must not be deleted from the operator's maintenance program. Furthermore, ATA 20 tasks must not be deleted (these are L/HIRF and EZAP tasks for which there is no FEC).

– For Operators under U.S. FAA Jurisdiction only:
  Operators requesting revisions to the baseline EWIS task or description must submit their request through the cognizant Flight Standards District Office, who may add comments and then forward it to the manager of the appropriate FAA Aircraft Certification Office, or office of the Transport aircraft Directorate, having cognizance over the type certificate for the affected aircraft for concurrence prior to approval. Task intervals may be revised through normal operator approval process.
  Tasks indicated with "(EWIS)" after the task description must not be deleted from the operator's maintenance program.
– For Operators Not under U.S. FAA Jurisdiction:
  Operators requesting revisions to the EWIS requirements may revise these tasks and intervals through their normal operator approval process. Tasks indicated with "(EWIS)" after the task description must not be deleted from the operator's maintenance program.

B. ALS Part 2 (DT-ALI) tasks:

Threshold and intervals of the DT ALIs cannot be increased, unless advised by the manufacturer following approval by the Authority of the State of aircraft registry.

C. ALS Part 3 (CMR) tasks:

Certification Maintenance Requirements (CMR) tasks generated by systems safety assessment shall not be deleted from an operator's maintenance program.

– CMR*:
  One Star CMRs specified in the ALS Part 3 are mandatory tasks and cannot be changed or deleted without the concurrence of the Primary Certification Authority (EASA). One Star CMR task intervals quoted in ALS Part 3 are absolute limitations and cannot be escalated without the concurrence of the Primary Certification Authority (EASA).
– CMR**:
  Two Star CMRs specified in the ALS Part 3 are mandatory tasks and cannot be changed or deleted without the concurrence of the Primary Certification Authority (EASA). Two Star CMR task intervals may be adjusted in accordance with an Operator's approved escalation practices or an approved reliability program, but the task content may not be changed or deleted without prior Primary Certification Authority (EASA) approval.

7. PERMITTED VARIATIONS TO MAINTENANCE PERIODS

(alternatively referred to as Short-Term Extension or Short-Term Escalation)

A. GENERAL

A permitted variation should normally be granted by the National Aviation Authority (NAA), unless that Authority has agreed to delegate such possibility to the operator. A permitted variation to a period required by the maintenance programme may be granted by the Authority on a case-by-case basis on occasions where the operator does not have the ability to perform the required maintenance within the prescribed interval. Contrary to an amendment to the Maintenance Programme, a permitted variation applies to a unique aircraft, for a unique occasion.

A permitted variation should not be understood to be a maintenance planning tool, but as an exceptional means to allow the operator to fly for a limited period of time until the required maintenance is performed. The use of this provision should be limited to occasions when compliance with the approved maintenance programme cannot be achieved due to circumstances which **could not reasonably have been foreseen by the operator**. Typical reasons could include:

- failure of the ground support equipment required to perform the task or
- non-availability of a hangar due to late release of another aircraft or
- significant ground damage event on another aircraft in the fleet, or
- failure of an external provider to deliver according to agreed schedule.

It is normal practice for an operator to include the permitted variation policy in their Continuing Airworthiness Management Exposition, Continuous Airworthiness Maintenance Program (CAMP) or equivalent. The details of this will be determined in conjunction with the operator's NAA.

The text in the paragraph below titled MAXIMUM VARIATIONS constitutes an Airbus recommendation that may be useful to operators in the absence of NAA guidelines on the subject. These are based on Temporary Guidance Leaflet (TGL) N° 26 formerly established by JAA. EASA subsequently determined that the use of Variations is an operational issue and thus the responsibility for issuing such guidelines is that of the NAA. As a result, the JAA document was cancelled and can no longer be quoted as a reference.

Examples of National guidelines include CAA (UK)'s CAP 562 Book 2, Leaflet 5-30 paragraph 6 & Appendix A and FAA's Flight Standards Information Management System (FSIMS) Order 8900.1 Volume 3 Chapter 37 Section 1.

The policy related to permitted variations does not apply to all maintenance tasks. The list of prohibitions may vary according to NAA guidelines. In the absence of local guidance, the following should be considered as excluded:

1. Life limitations identified in the ALS Parts 1, 4 and 5
2. Tasks required to satisfy Airworthiness Directives related to a specific unsafe condition
3. Damage - Tolerant Airworthiness Limitation Items as stated in ALS Part 2
4. Certification Maintenance Requirements, unless specified otherwise in the ALS Part 3 document
5. Systems Equipment Maintenance Requirements (formerly Aging Systems Maintenance), unless specified otherwise in the ALS Part 4
6. Fuel system Airworthiness Limitation Items, unless specified otherwise in the ALS Part 5 document
7. ETOPS CMP maintenance tasks with intervals quoted as 'not to exceed', unless specified otherwise in the CMP document.
   Note: Any ETOPS related tasks not excluded by the above can benefit from a permitted variation

without impacting the ETOPS capability, i.e. ETOPS flights may be conducted while under the permitted variation.

NOTE: The above list of exclusions does not mean that the Authority cannot permit a deviation of an AD, Life Limitation etc., but that this paragraph addressing a generic permitted variations policy does not apply to such tasks.

Variations greater than those detailed in paragraph PERMITTED VARIATIONS TO MAINTENANCE may be justifiable on a case by case basis taking into account the specific aircraft and its service history. Operators are invited to contact Airbus Maintenance Programs Engineering (via TechRequest) to identify the potential for issuance of an Airbus Statement of Airworthiness Compliance (ASAC) or Airbus Maintenance Program Engineering Statement (AMPES) which, if feasible and appropriate, may be used to support the operator's discussion with their local Authority. Details of the ASAC are provided in OIT references:

For ASAC purposes:

999.0086/09 dated 5 October 2009

999.0076/12 dated 3 October 2012

For AMPES purposes:

999.0069/19 dated 9 October 2019

B. PERMITTED VARIATIONS TO MAINTENANCE

The maximum variation of a prescribed period is indicated below.

1. Items controlled by flight hours:
   (i) 5000 flying hours or less: 10%
   (ii) More than 5000 flying hours: 500 flying hours
2. Items controlled by calendar time:
   (i) 1 year or less: 10% or 1 month whichever is the lesser
   (ii) More than 1 year, but not exceeding 3 years: 2 months
   (iii) More than 3 years: 3 months
3. Items controlled by landing/cycles:
   (i) 500 landings/cycles or less: 5% or 25 landing/cycles, whichever is the lesser.
   (ii) More than 500 landings/cycles: 5% or 250 landings/cycles, whichever is the lesser.
4. Items controlled by more than one limit:
   For items controlled by more than one limit, e.g. items controlled by flying hours and calendar time or flying hours and landings/cycles, the more restrictive limit should be applied.

8. GENERAL RULES

The following rules apply to the A320 FAMILY maintenance program:

A. The operator's manuals shall contain the details and responsibilities for accomplishing the maintenance identified by this document.

B. The overall reliability of the aircraft will be monitored by each operator's system for continuous analysis and surveillance as required by the operator's Regulatory Authority.

C. Each operator should be aware of the various inspection techniques such as X-Ray, ultrasonic, eddy current, radio isotope, which are available and described in the Non Destructive Testing Manual (NTM).

The use of such techniques can be developed to provide a valuable adjunct to the prescribed visual inspections. For any substitution of such inspection technique, it must be ensured that the same damage size will be detectable by the proposed technique with, at least, the same level of confidence

D. Items that are life limited will be removed from service according to the life limits stated in the appropriate section of the engine or aircraft manufacturer's manuals. These sections are referenced in the aircraft "Type Certificate Data Sheet".

E. Tasks may be considered to conform to the requirements of the scheduled maintenance if accomplished as part of a Regulatory Authorities approved/accepted equivalent check/test by flight crew.

F. It is the responsibility of each operator to adjust his own maintenance program in accordance with his National Requirements and to comply with existing rules with respect to reporting to his Regulatory Authority and to the manufacturer events having effects on the continued airworthiness of the aircraft.

G. The maintenance clock does not stop while the aircraft is on ground or in maintenance condition. Although the aircraft does not collect any FH or FC when being on ground, attention has to be given to tasks, where the interval is expressed in calendar time (hours, days, month, year). All tasks that become due while the aircraft is on ground or at the time of the maintenance visit have to be performed before the next flight. However, there is no need to repeat inspections during the time on groundl in maintenance condition, E.g. during a 4 weeks downtime, tasks with interval 8 DY only need to be performed at the end of the time on ground or maintenance visit (before the next flight).

H. The operator should be aware of manufacturer and vendor recommendations and/or requirements published through Inspection Service Bulletin (ISB), In-Service Information (ISI), Service Information Letter (SIL), All Operators Letter (AOL), Alert Operators Transmission (AOT) and similar documents dealing with scheduled maintenance. These are no longer reflected in the MPD and it is thus the operator’s responsibility to review these and determine whether or not to include them in their locally approved programs.

I. Local National Requirements may not be addressed by tasks included in the MPD.

J. The reapplication of all protective materials (e.g. Temporary Protection Systems (TPS), paints etc.) shall be carried out following their removal to perform the inspection/maintenance task.

K. The operator shall refer to Airbus additional technical publications (Aircraft Maintenance Manual, Non Destructive Testing Manual, Structural Repair Manual) for maintenance practices and procedures.

L. For Power Plant, APU and main components, the operator should also consider manufacturer's manuals for additional tasks once the engines or the components are in the shop.

M. For Maintenance Standards applicable to ETOPS operators should refer to the relevant ETOPS CMP Document (Ref.: SA/EASA : AMC 20–6/CMP) as the authoritative document. Where maintenance task intervals in the CMP are more restrictive than required in the MRBR, these overrule those in the

MRBR. Where the MRBR task interval is more frequent than required by the CMP, the MRBR value remains valid until the operator justifies escalation (the CMP interval acts as an upper limit to the escalation). Maintenance tasks, which become non-applicable due to an authorized configuration change do not need to be retained in the operator's program.

N. Any fairings, panels, doors or other items which are removed/opened to gain access for maintenance tasks must also be inspected for general condition with a minimum level of GVI before reassembly/refitting.

O. Tasks approved from Fuel Tank Safety (FTS) Requirements using the criteria established in Special Federal Aviation Regulation (SFAR88) / EASA policy statement on the process for developing instructions for maintenance and inspections of fuel tank system ignition source prevention; are identified by (SFAR 88) in parenthesis following the task description.

For Operators under U.S. FAA Jurisdiction only:

Refer to MRB Report Section F for detailed information.

For Operators not under U.S. FAA Jurisdiction:

Operators requesting revisions to the baseline FTS requirements may revise these tasks and intervals through their normal operator approval process.

P. For Airbus operators common benefit, operators are encouraged to report any significant maintenance information which they feel may help to improve the MPD.

Q. The tasks reflected in the MPD are sufficient to address environmental / weather conditions that are typically encountered in operation. Additional recommendations may be provided in other documents (see General Rule H). For example, aircraft operating at temperatures lower than -15°C during a certain period (i.e. winter time) can be considered as cold weather impacted. For those aircraft, Flight Schedule Delays, Cancellations and Aircraft on Ground (AOG) time caused by cold weather can be minimized by carrying out appropriate tasks at the beginning and during the winter period. Detailed Information and Guidance is provided by ISI 12.00.00007.

R. The interval selected for restoration of A320 FAMILY EV Gear is 144 MO or 20000 FC. This interval will be validated through evaluation of the results of a sampling program as described in Airbus Document "AIRBUS A320FAMILY LANDING GEAR SAMPLING PROGRAM" (Ref. SA32WD1403534). The sampling program, managed by Airbus, will continue until sufficient data has been compiled. In absence of sufficient justification to validate the Landing Gear overhaul interval, or if the data collected from in-service experience does not support the current restoration interval, the A320 FAMILY MRB will reduce the Landing Gear overhaul interval to a value deemed acceptable to them. Airbus will notify the MRB of all planned sampling inspections sufficiently well in advance to enable them to attend or to delegate representation. Throughout the program, Airbus will forward all teardown reports and recommendations to the MRB for review. Initially, the sampling program is foreseen to justify the calendar interval, an additional sampling program to validate the FC interval will be established later in view of the A320 FAMILY fleets utilizations.

Any amendment to the FC interval applicable to the classic Landing Gear (PRE EV Gear) needs to be validated for the EV Gear.

Unless otherwise notified by Airbus, Operators may assume, for maintenance planning purposes, that the restoration interval for A320 FAMILY EV Landing Gear is 144 MO or 20,000 FC.

S. All MRB Report tasks that identify requirements specific to components and having intervals expressed in terms of FH, FC or Calendar Time may be managed according to aircraft service history unless otherwise stated.

9. TASK DATA DESCRIPTION

– General:

The section (and subsection, where applicable) number, title and revision date are indicated at the bottom of each page.

Presentation of maintenance tasks (Ref. to illustration at end of this paragraph)

– Within each subsection, tasks are listed by increasing task number.
– Where a task description runs onto a second page, the reminders "***continued***" and "***continue***" are printed respectively at the bottom of the first page concerned and at the top of the next.
– The mention "***end***" is printed at the end of the last task description in each subsection.
– A common form is used for section “Systems, APU and Power Plant” (Ref. to illustration at end of this paragraph) and provides the following information:

A. Revision code

For all new, revised or deleted tasks, in comparison to the previous revision, revision codes are given.

– N = New
– R = Revised
– D = Deleted

B. Task number

Each task is identified by a specific MPD task number. When a task applies to two specific main zones located symmetrically to either side of the aircraft centerline, the task is assigned a single task number, but both LH and RH zones are indicated in "ZONE" column.

The task number comprises 9 to 10 digits organized as follows :

XXXXXX-XX-(X)X, where:

The first block of 6 digits includes the ATA reference or zone,

the second block of 2 digits is a sequence number identifier,

the third block of 1 or 2 digits is an applicability index (the second digit is not shown in the below graphic).

* ATA reference or zone

– Section 2 : The ATA reference identifies the system/sub system or component on which the task is to be accomplished.

– Section 3 : The ATA reference identifies the structural significant item on which the task is to be accomplished (reference identical to that used in the MRB report).

– Section 4 : The zone number is preceded by the letter code "ZL". For task to be repeated in several main zones, the first main zone or left hand zone number is used (Task Reference identical to that used in the MRB Report, for zone drawings and the definition of zone boundaries see MRBR Appendix 2).

* Sequence number

Apart from a few cases, the sequence number is used to discriminate between different tasks relating to the same hardware
In System, APU and Power Plant section, the first digit identifies the engine type concerned

"0" for Honeywell GTCP 36-300 (MRBR reference "XX.XX.XX/XX–36")

"A" for APIC APS 3200 (MRBR reference "XX.XX.XX/XX–32")

"B" for Honeywell 131-9(A) (MRBR reference "XX.XX.XX/XX–13")

"C" for CFM56–5 (MRBR reference "XX.XX.XX/XX–C5")

"I" for IAE V2500 (MRBR reference "XX.XX.XX/XX–I2")

"P" for PW6000A (MRBR reference "XX.XX.XX/XX–P6")

"W" for PW1100G (MRBR reference "XX.XX.XX/XX–P1")

"L" for LEAP-1A (MRBR reference "XX.XX.XX/XX–CL")

* Applicability index

The applicability index identifies successive developments of a task, introduced by modifications or specific requirement. However, in a few cases, the sequence number may be used for that purpose, when referenced documentation requires to do so.

The technical status or specific requirement associated with each applicability index is specified in the applicability column. As a general rule, tasks with the same first 8 digits in task number, have same work description in the AMM.

C. Zone column

The 'Zone' column shows the position(s) where the task has to be accomplished (repeated) according to the description. Quoting several positions means that the task has to be repeated in each zone.

Each position is identified by one zone number or one sub-major zone number or one major zone number.

When sub-major or major zone number is quoted to identify a unique position of a task, the more precise zone numbers are quoted in the description in case such additional information is estimated useful.

D. Description column

This column provides the following information:

* Task title

Identifies the system/sub system/component/zone/structural significant item concerned by the task.

* Skill Code

Specifies the type of skill required for task accomplishment.

NOTE: Operators may adjust the Skill Code to local requirements. Each operator should know and assess himself, which skill is required according to his operational and legal framework.

SKILL CODE	DEFINITION	SCOPE
AF	Airframe	Hydro-mechanical, environmental, fuel, oxygen and cargo systems. Associated servicing/inspections requiring a certain qualification such as: Flaps/Slats. Landing Gear. THS actuator. Structure Visual Inspection. ZONAL GVI including EWIS
AV	Instrument	Autopilot. Instruments. Digital equipment. Fire protection.
CA	Cabin / Utility	Furnishing, galleys.
EL	Electrical	Electrical generation, distribution and associated services and components.
EN	Power Plant	Engines and APU accessories. Associated services.
NDT	Non Destructive Test	All Non-destructive test inspection and borescope inspection.

SKILL CODE	DEFINITION	SCOPE
RA	Radio	Radio and radio navigation. Audio interphone, CVR, Passenger address.
UT	Utility	Toilets water, wastewater.

* Task Code

Provides a code reflecting type of task.

TASK CODE	DEFINITION
BSI	Borescope inspection
CHK	Check for condition, leaks, circuit continuity, check fluid reserve on item, check tension and pointer, check fluid level, check detector, check charge pressure, Leak check/test.
DET	Detailed inspection
DIS	Discard
FNC	Functional check/test
GVI	General visual inspection
LUB	Lubrication
OPC	Operational check/test
RST	Restoration
SDI	Special detailed inspection
SVC	Drain, Servicing, Replenishment (fluid change),
TPS	Temporary protection system
VCK	Visual check

* Task description

Gives a concise description of the work to be performed.

* Task preparation (where applicable).

Specifies the preliminary steps (from a pre-established list) to be performed prior the maintenance task itself.

If Floor panels of passenger cabin and cargo holds are to be removed, they are not designated by their identifiers but by the frame numbers between which the floor panels have to be removed are quoted.

* Access (where applicable)

Specifies the identifiers of the access panels, linings or doors to be opened or removed for accomplishment of the task.

* TPS (where applicable)

Specifies the type of Temporary Protection System (TPS) to be applied as indicated below:

"1"	:	Type 1 Grade 2 or Grade 3 TPS is to be applied.
“2”	:	Type 2 Grade 2 TPS is to be applied.
"1+2"	:	Type 1 TPS plus a subsequent application of Type 2 TPS is to be applied. Alternatively, Type 3 TPS can be applied. Type 3 TPS is an alternative material that may be used as a replacement for the combined Type 1 and Type 2. Also, Type 3 TPS may be used in place of Type 1 or Type 2, except for movable parts, for which only Type I Grade 2 is permitted.
"No"	:	TPS must not be applied in the area (example: inside fuel tank, pylon).

Specifications for TPS are available in AMM chapter 20-31-00 / Materials list / Storage Preservation.

E. Time Controlled Items (TCI) column

TCI markers are set in order to provide assistance in planning removable assets installed on the A/C.

MPD tasks marked as TCI are connected to the removal/installation of components/parts, which are to be restored/overhauled/tested in a workshop and then may be re-installed on a different A/C (rotables).

This does not include components removed, cleaned and put back on the same A/C without going into a workshop.

The utilization and selection of TCI is left completely to the discretion of the operator.

Operator specific TCI selection could e.g. reflect components, which often (or likely) rotate between A/C due to unscheduled and scheduled replacements.

NOTE: TCI markers are to be seen as a planning help. They are neither demanded by any source document nor by any certification authority.

F. Removable Structural Components (RSC)

RSC markers (“R”) are set in order to provide assistance in planning Removable Structural Components installed on the A/C.

MPD tasks marked as with “R” are connected the Removable Structural Component (RSCs) which may be typically interchanged between different airplanes by operators (removable / rotables).(e.g., flight controls, lift devices, doors for which specific instructions for removal/replacement have been

published (e.g., AMM, SBs), for which CMMs have been published, or, based upon previous experience, have been typically interchanged between aircraft).

The utilization and selection of the RSC is left completely at the operator discretion.

Operators specific RSC selection could e.g reflects components, which often (or likely) rotate between A/C due to unscheduled and scheduled replacement.

Note: RSC markers are to be seen as a planning help to assist in controlling and/or tracking maintenance requirements on RSCs. This marker are not demanded by any source document nor by any certification authority.

NOTE: Due to technical reasons RSC markers are not reflected in the PDF version of the MPD.

G. Threshold/interval column

This column provides the following information :

* 100% Inspection Threshold

This information preceded by the letter "T" gives a specific value defining the first accomplishment deadline of the task. When threshold is equal to the interval, the letter "T" may not show.

When the threshold is expressed in several units, the conjunction "OR" separates the different indications.

* 100% Inspection Interval

This information, preceded by the letter "I", gives a specific value defining the maximum time that can separate two complete accomplishments of the task.

When the interval is expressed in several units, the conjunction "OR" separates the different indications.

* Sample Inspection Threshold

This information, preceded by the letter "ST", gives a specific value defining the first accomplishment deadline of the task. When threshold is equal to the interval, the letter "ST" may not show.

When the threshold is expressed in several units, the conjunction "OR" separates the different indications.

* Sample Inspection Interval

This information, preceded by the letter "SI", gives a specific value defining the maximum time that can separate two complete accomplishments of the task.

When the interval is expressed in several units, the conjunction "OR" separates the different indications.

H. Source code column

Specifies the source document.

ALI, ALI WFD	:	Task originated by Airworthiness Limitation Section (ALS) Part 2 - Airworthiness Limitation Items arising from fatigue and damage tolerance evaluation of damage tolerant structural elements whose failure could contribute to catastrophic failure of the aircraft (FAR/JAR 25.571) and Airworthiness Limitation Items arising from an initial evaluation of Widespread Fatigue Damage

MRB	:	Task originated from the MRB Report. For tasks resulting from a System/APU/Power Plant analysis, the three letters "MRB" are followed by the corresponding Functional Failure Effect category (5 – 9). 5 : Evident Safety 6 : Evident Operational 7 : Evident Economic 8 : Hidden Safety 9 : Hidden Non Safety
CMP	:	Task originated by ETOPS CMP DOCUMENT (Configuration, Maintenance, Procedure and Dispatch Standards for Extended Diversion Time Operations). This document lists the standards for ETOPS.
CMR**	:	Task is an Airworthiness Limitation Section (ALS) Part 3 task - Certification Maintenance Requirement. Its interval may be changed in accordance with an Operator's approved escalation practices or an approved reliability program. Cannot be changed or deleted from operator maintenance program, without the concurrence of the Primary Certification Authority (EASA).
CMR*	:	Task is an Airworthiness Limitation Section (ALS) Part 3 task - Certification Maintenance Requirement. Its interval cannot be escalated by an Operator, without the concurrence of the Primary Certification Authority (EASA). Cannot be changed or deleted from operator maintenance program, without the concurrence of the Primary Certification Authority (EASA).
CPCP	:	Task that contributes to the Corrosion Prevention and Control Program.
FAL	:	Task originating from Airworthiness Limitation Section (ALS) Part 5 (Section 4) - Fuel Airworthiness Limitation.
FMP	:	Task that contributes to the Fatigue Monitoring Program. The Fatigue Monitoring Program (FMP) is defined to indicate unpredictable early occurrence of fatigue related deterioration on metallic structure. Tasks are listed in a dedicated non MRB approved Appendix of the MRB Report.
LUR	:	“Low Utilization Recommendation identifier” (this is not a source document but identifies tasks having additional low utilization calendar time values).
SEMR	:	Task originated by Airworthiness Limitation Section (ALS) Part 4 (Section 4) - System Equipment Maintenance Requirements

I. Reference column

This column provides :

* The AMTOSS reference of the task in the A320 FAMILY Aircraft Maintenance Manual.
* References to technical publications where accomplishment instructions can be found.
* Tasks with a CMP source reference are “ETOPS” related.
* The MRB reference of the task.
  MPD tasks in section 2 provide the MSI reference task number of the covered MRBR task.

MPD tasks in section 3 provide the SSI reference task number of the covered MRBR task.
MPD tasks in section 4 provide the ZIP reference task number of the covered MRBR task.

* The ALS references of the task.
MPD tasks in section 3 provide the ALI reference (from ALS Part 2).
MPD tasks in section 2 provide the
— CMR reference (from ALS Part 3),
— SEMR reference (from ALS Part 4),
— FAL reference (from ALS Part 5).

J. Men column

This field contains the minimum number of men to perform the task.

K. MH column — Task Man-Hours

The TASK MH field contains the sum of man-hours required to perform the task per zone. Man-hours only apply for on-aircraft maintenance. Off-aircraft maintenance, performed in the workshop, is not considered.

NOTE: MPD man-hours are not to be mistaken with elapsed time.

Man-hours are expressed in industrial hours. Where “TBD” is quoted, the man-hours are still to be defined. Where “N/A” is quoted, man-hours are not applicable, e.g. shop maintenance. For tasks where different configurations are possible, e.g. in the cabin, the task man-hours based on the configuration defined in the „Airbus Standard Specification“.

For the calculation of MPD man-hours, the following assumptions apply:

1. The aircraft is in general maintenance condition as described in the AMM.

2. Maintenance personnel is adequately skilled and experienced to perform the task.

3. Airbus recommended equipment is used.

4. Tanks are de-fueled where tank opening required.

5. Standard safety devices and warning notes are in position.

6. The aircraft is in a clean condition for inspections.

Man-hours quoted in the MPD do not take into account:

1. Non-routine work, e.g. repair, troubleshooting, shop overhaul.

2. Preparatory work such as aircraft cleaning, positioning work stands, connecting ground power carts.

3. One-time actions, e.g. de-greasing, stripping, painting.

4. Embodiment of modifications, cabin (galley, lavatory, furnishings) refurbishment.

5. Non-productive time, e.g. shift-change, set-up of tools, waiting for sealant or paint drying.

6. Planning and establishment of procedures.

The task man-hours quoted in the MPD are provided for guidance only and should be adjusted to the specific operator conditions and efficiency.

L. MH column — Access Man-Hours

The ACCESS MH field contains the man-hours for opening and closing of access panels, nacelles- and doors. Either removal/installation or opening/closing is reflected, depending on access panel type. Some panels may be grouped and quoted as preparations, for easier presentation and planning, especially among the cabin linings. The number of men for access work is not given.

M. MH column — Preparation Man-Hours

The PREP MH field contains the man-hours to perform the preparation for a task. Removal and installation are included in the preparation man-hours. For preparations where different configurations are possible, e.g. in the cabin, the preparation man-hours based on the configuration defined in the „Airbus Standard Specification“. Adjustment of the preparation men-hours to the operators cabin configuration and optional equipment may be necessary. The number of men for the preparation work is not given.

N. Applicability Column

The information given in this column defines the technical status of the aircraft on which the task is applicable.

The technical status is expressed as one, or a combination, of the following keywords :

– "ALL" indicates that the task is applicable to all A318, A319, A320 and A321 aircraft.
– A keyword identifying the aircraft series or model (A320, A319/A320/A321).
– A keyword identifying the power plant type and model (CFM, IAE, PW, LEAP-1A).
– A keyword identifying the APU type and model:
  APS 3200: APIC APS 3200
  GTCP 36-300: Honeywell (formerly GARRETT) GTCP 36-300
  131-9(A): Honeywell (formerly ALLIED SIGNAL) 131-9(A)
– A keyword defining the status with respect to a modification number (PRE 20024 signifies all A318, A319, A320 and A321 aircraft "without modification 20024", keyword "POST 20024" signifies "all A318, A319, A320 and A321 aircraft with modification 20024. When a modification can be retrofitted through an AIRBUS Service Bulletin, the SB number is given between brackets just below the modification number. A comma between two SB brackets means a logical “OR” while an “&” between two SB expressions is equivalent to a logical “AND”.
– When applicability is the result of combination of modifications:

Example	**Explanation**
POST 28101 OR POST 35080	Task applies to all A/C with modification 28101 or 35080 embodied, i.e. to A/C with one of the modifications or both modifications embodied. Applicable to aircraft having: ((MOD))OR((MOD))
POST 23002 PRE 24596	Task applies to all A/C with modification 23002 embodied AND modification 24596 NOT embodied, i.e. both modification status must be met. Applicable to aircraft having: ((MOD)AND NOT(MOD))
POST 32025 (57–1118)	Task applicability includes aircraft with production MOD 32025 and aircraft without production MOD 32025 on which the same modification has been retrofitted by SB 57-1118 after entry into service. Applicable to aircraft having: MOD OR SB

Example	Explanation
A320 PRE 24135 (27-1070) PRE 26786 (27-1120)	Task is applicable to A320 A/C if both Modifications 24135 (OR SB 27–1017) AND 26786 (or SB 27–1120) are NOT installed/accomplished on the aircraft. Applicable to aircraft having: ((AC-TYPE)AND NOT(MOD OR(SB))AND NOT(MOD OR(SB)))
PRE 23051 (27-1057) OR PRE 23061 (27-1110), (27-1902)	Task applies to all A/C WITHOUT modification 23051 (Service Bulletin 27–1057 NOT embodied) OR to all A/C WITHOUT modification 23061 (NEITHER Service Bulletin 27–1110 NOR Service Bulletin 27–1902 embodied). Applicable to aircraft having: (NOT(MOD OR(SB)))OR(NOT(MOD OR(SB)OR(SB)))
POST SB 57-1118	Task applicability includes only aircraft delivered without the related production modification, on which this kind of modification (MOD 32025) has been retrofitted by SB 57–1118 after entry into service. Applicable to aircraft having: SB
POST 21290 P1546	This requirement is applicable to aircraft on which modification 21290 (with modification proposal P1546) has been embodied.
ACT	Task applies to the Additional Center Tank.

- The aircraft Manufacturer Serial Number (MSN) or a block of consecutive serial numbers (e.g. 0005 – 0007 signifies that the task is applicable on aircraft MSN 5, 6 and 7).
- The keyword "FAA" indicates that the task is applicable only to aircraft flying under FAA requirements. The keywords "EXCEPT-FAA" indicates that task is applicable except for aircraft flying under FAA requirements.
- The keyword "ETOPS" indicates that the task is applicable only when “EXTENDED RANGE OPERATIONS ARE UNDERTAKEN”. The keywords “NON-ETOPS“ indicate that task is applicable, when Extended Range Operations are not undertaken.
- A conditional applicability such as “If equipment installed” is selected when a large amount of modification or combination of modification are applicable to a partic ular item for a given equipment. This avoids stating a complex applicability, which could be confusing and inappropriate for operators. e.g. MPD task 252100-07-1 with the applicability “AMSAFE NEXGEN AIRBAG SYSTEM INSTALLED”.
- GROUP APPLICABILITY
  Since entry into service of the A320 FAMILY, additional types and models have been developed and certified. Also modification have been introduced. In some cases this may lead to a complex applicability expression or to a need for frequent applicability update. To ease the reading and to limit the number of different applicability expressions, for certain configurations a “Configuration Group” has been established (from MPD REV 40). This will also limit the number of changes for subsequent revisions of the document.

The below table gives the configuration or modification expression valid for a GROUP ITEM.

THE UPDATE OF A GROUP ITEM WILL AFFECT ALL TASKS WHERE THIS IS STATED IN THE APPLICABILITY.

GROUP ITEM (Applicability Text in tasks)	**CONFIGURATION FORMULA** (Boolean expression)

10. MAINTENANCE TASK REPORTING SYSTEM

An Airbus database has been designed and dimensioned to receive data on a continuous flow basis. Operators are therefore requested to report data from all maintenance checks. The data should include all task results, findings and nil findings. The reporting and collection of nil-findings allows a computation of finding rate (finding/nil-finding ratio) which may be used for future maintenance program optimization.

Please refer to AirbusWorld eSite:*Airbus World > Content Library > Maintenance & Engineering > Template* Then select the appropriate aircraft type or family. This then gives access to the appropriate reporting spreadsheet.

All reports should be sent to MPDtask.Reports@Airbus.com. Any related questions should be sent to the same address. Operators will receive an acknowledgement for data reports..

This then gives access to the appropriate reporting spreadsheet.

Analysis of the reported data will enable Airbus to monitor the effectiveness of the Maintenance Program and to further optimize it. Airlines who report data will also have the possibility to benchmark task findings statistics against the reported data of other Airlines.

Associated guidelines can be found under: *Home > IDOLS for Scheduled Maintenance > Support > MPD Task Reporting Guidelines.*

NOTE: This MAINTENANCE TASK REPORTING SYSTEM does not take precedence over existing national requirements for occurrence reporting.

11. GLOSSARY

Calendar Times (MO, YE)

Month(s) : equivalent of 1 calendar month (can be calculated as 1/12 calendar year)

Year(s) : equivalent of 12 calendar month (can be calculated as 365.25 days)

Check

Task performed to ensure that a system or component is still serviceable (check of bottle weight, check of firing circuit continuity, etc...) or that pressures or fluid levels are correct (See also visual check).

Customizable Equipment

Equipment having a vendor interval recommendation that has been reviewed, changed as appropriate, and declared as either an MRBR interval, ALS interval or an Airbus recommended interval.

Discard (DIS)

The removal from service of an item at a specified life limit.

Flight Cycle(s) (FC)

A complete take-off and landing sequence.

Functional Check (FNC)

A quantitative check to determine if one or more functions of a system/sub system or component performs, within specified limits.

This task may call for the use of special test equipment.

Inspection - Detailed: (DET)

An intensive examination of a specific item, installation or assembly to detect damage, failure or irregularity. This could include tactile assessment in which a component or assembly can be checked for tightness/security. Available lighting is normally supplemented with a direct source of good lighting at an intensity deemed appropriate. Inspection aids such as mirrors and magnifying lenses may be necessary. Surface cleaning and elaborate access procedures may be required.

Inspection - General Visual: (GVI)

A visual examination of an interior or exterior area, installation or assembly to detect obvious damage, failure or irregularity. This level of inspection is made from within touching distance, unless otherwise specified. A mirror may be necessary to enhance visual access to all exposed surfaces in the inspection area. This level of inspection is made under normally available lighting conditions such as daylight, hangar lighting, flashlight or drop-light and may require removal or opening of access panels or doors. Stands, ladders or platforms may be required to gain proximity to the area being checked. Basic cleaning may be required to ensure appropriate visibility.

Inspection - Special Detailed: (SDI)

An examination of a specific item, installation, or assembly making use of specialized inspection techniques such as Non Destructive Testing (NDT) and/or equipment (e.g. boroscope, videoscope, tap test) to detect damage, failure or irregularity. Intricate cleaning and substantial access or disassembly procedures may be required. Classification of a task as an SDI does not define the required qualifications for the person performing the task.

Lubrication (LUB)

Term covering all types of lubrication by grease gun, squirt can, spray, brush or hand application for the purpose of maintaining the inherent design operating capabilities of an item.

Maintenance Task

An action or set of actions, including corresponding planning data, required to achieve a desired outcome which maintains an item (component, system/sub system, structure) in or restores an item to serviceable condition. This term includes inspection and determination of condition.

Maintenance Significant Item (MSI)

Item identified by the manufacturer, whose failure :

- Could affect safety (on ground or in flight), and/or
- Is undetectable or not likely to be detected during operation, and/or
- Could have significant operational impact, and/or
- Could have significant economic impact.

NDT-Inspection

Non-destructive inspection procedure, e.g. eddy current, ultra sonic.

Operational Check (OPC)

A task to determine qualitatively that an item is fulfilling its intended purpose. This task may include the reading of the aircraft instruments but does not require the measurement of tolerances. This is a failure finding task.

Repeat Interval

The maximum permitted period (for all tasks not performed on a sampling basis) that can separate total completion of a task from its next accomplishment.

Replacement

The action whereby an item is removed and another new or restored item is installed in its place.

Restoration (RST)

Term covering all actions (on/off the aircraft) necessary to return the item to a specific standard.

Sampling

The monitoring and/or withdrawal of selected devices from service to permit determination of their condition at predetermined progressive intervals.

Sampling Concept

Inspections on specific aircraft selected from those which have the highest operating usage in order to identify the first evidence of deterioration in their condition caused by fatigue damage or corrosion.

Structure Significant Item (SSI)

A structural detail, structural element or structural assembly which is judged significant by the manufacturers because of the reduction in aircraft residual strength or loss of structural function which are consequences of its failure.

Threshold

Limit deadline for all tasks not performed on a sampling basis at which the task must be accomplished for the first time (subsequent accomplishment deadlines are obtained by adding the repeat interval and its multiples to the threshold).

Visual Check (VCK)

An observation to determine that an item is in its intended state. Does not require quantitative tolerances. This is a failure finding task with obvious pass/fail criteria.

SERVICE BULLETIN LIST

The following table lists the MOD SBs, which are stated in the Applicability column of the MPD Task Data.

SB Number	REV	Vendor	SB Number	Incorporation Status	SB Title	Customer work order	Embodiment status
00-1003				IN PROGRESS	CONVERSION OF A/C MSN 085 TO ITF CONFIGURATION		
21-1013				IN PROGRESS	INSTALLATION OF NEW GRID IN COCKPIT AIR DUCT TO AVOID ICE CHIPS IN COCKPIT		
21-1017				IN PROGRESS	AIR CONDITIONING - AVIONIC VENTILATION ADD NON RETURN VALVE		
21-1031				IN PROGRESS	AIR CONDITIONING - AIR COOLING - INSTALL OZONE CONVERTERS		
21-1047				IN PROGRESS	AIR CONDITIONING - CARGO COMPARTMENT - INSTALL A VENTILATION SYSTEM IN THE AFT CARGO COMPARTMENT		
21-1051				IN PROGRESS	AIR CONDITIONING - AIR COOLING SYSTEM IMPROVE RAM AIR OUTLET		
21-1067				IN PROGRESS	AIR CONDITIONNING - AVIONICS EQUIPMENT/ GROUND COOLING - INSTALL COOLING SYSTEM		
21-1078				IN PROGRESS	AIR CONDITIONING - AVIONICS VENTILATION INSTALL A DRAINAGE DOWNSTREAM OF THE BLOWER		
21-1087				IN PROGRESS	AIR CONDITIONING - AVIONICS EQUIPMENT VENTILATION - INSTALL PALL FILTER INSTEAD OF LE BOZEC.		
21-1091				IN PROGRESS	AIR CONDITIONING - AIR COOLING SYSTEM - INTRODUCE MODIFIED RAM AIR INLET		
21-1101				IN PROGRESS	AIR CONDITIONING - AVIONICS EQUIPMENT VENTILATION - INTRODUCE NON RETURN VALVE ON GROUND REFRIGERATION UNIT AIR INLET.		
21-1113				IN PROGRESS	AIR CONDITIONING - AVIONICS VENTILATION - INTRODUCE SEPARATE AVIONICS VENTILATION DRAINAGE.		
21-1119				IN PROGRESS	AIR CONDITIONING - AIR COOLING - INSTALL OZONE CONVERTER ENGELHARD PN 20499003 OR PN 20499004		

SB Number	REV	Vendor	SB Number	Incorporation Status	SB Title	Customer work order	Embodiment status
21-1148				IN PROGRESS	AIR CONDITIONING - AVIONICS EQUIPMENT GROUND COOLING - DEACTIVATE THE GROUND REFRIGERATION UNIT (GRU).		
21-1150				IN PROGRESS	AIR CONDITIONING - AIR COOLING - INSTALL IMPROVED RAM AIR OUTLET (RAO)		
21-1152				IN PROGRESS	AIR CONDITIONING - AVIONICS EQUIPMENT GROUND COOLING - REMOVE GROUND REFRIGERATION UNIT.		
21-1153				IN PROGRESS	AIR CONDITIONING - AIR COOLING SYSTEM - PTFE SEALS FOR AIR CONDITIONING		
21-1157				IN PROGRESS	AIR CONDITIONING - CARGO COMPARTMENT VENTILATION - INSTALL AFT CARGO COMPARTMENT VENTILATION SYSTEM		
21-1165				IN PROGRESS	AIR CONDITIONING - GENERAL - REPLACE NSA8206 SEALS BY ABS5800 PTFE SEALS IN SEVERAL ATA 21/36 SUB-SYSTEMS		
21-1171				IN PROGRESS	AIR CONDITIONING - AVIONICS EQUIPMENT - INSTALL GROUND REFRIGERATION UNIT (GRU) FOR AVIONICS		
21-1173				IN PROGRESS	AVIONICS EQUIPMENT VENTILATION - AIR FILTERS SUPPLIER CHANGE FROM LE BOZEC TO PALL		
21-1175				IN PROGRESS	CARGO COMPARTMENT - INSTALL A VENTILATION SYSTEM IN THE AFT CARGO COMPARTMENT		
21-1179				IN PROGRESS	AIR CONDITIONING - INSTALLATION OF VENTILATION SYSTEM IN AFT AND FWD CARGO COMPARTMENT		
21-1183				IN PROGRESS	AIR CONDITIONING - AIR COOLING - INSTALL OZONE CONVERTER ENGELHARD PN 20499005 OR PN 20499006		
21-1200				IN PROGRESS	CARGO COMPARTMENT - INSTALL A VENTILATION AND HEATING SYSTEM IN THE AFT CARGO COMPARTMENT		

SB Number	REV	Vendor	SB Number	Incorporation Status	SB Title	Customer work order	Embodiment status
21-1205				IN PROGRESS	AIR CONDITIONING - AIR COOLING - INSTALL VOC/OZONE CATALYTIC CONVERTER FOR A/C WITH A318-TYPE ECS		
21-1207				IN PROGRESS	AIR CONDITIONING - AVIONICS EQUIPMENT GROUND COOLING - GRU REMOVAL		
21-1212				IN PROGRESS	AIR CONDITIONING - AIR COOLING VOC/OZONE CATALYTIC CONVERTER FOR A/C WITHOUT A318-TYPE ECS		
21-1215				IN PROGRESS	AIR CONDITIONING - CARGO COMPARTMENT - INSTALL A VENTILATION AND HEATING SYSTEM IN THE AFT CARGO COMPARTMENT (A/C WITHOUT ENHANCED CIDS)		
21-1219				IN PROGRESS	AIR CONDITIONING - CARGO COMPARTMENT - INSTALL A VENTILATION SYSTEM IN THE FWD AND AFT CARGO COMPARTMENT		
21-1221				IN PROGRESS	AIR CONDITIONING - CARGO COMPARTMENT - INSTALL A VENTILATION SYSTEM IN THE AFT CARGO COMPARTMENT		
21-1222				IN PROGRESS	AIR CONDITIONING - VENTILATION - INSTALLATION VENTILATION SYSTEM IN FWD CARGO COMPARTMENT (WITH ENHANCED CIDS)		
21-1223				IN PROGRESS	A320 - VENTILATION - INSTALLATION VENTILATION SYSTEM IN FWD CARGO COMPARTMENT (WITH ENHANCED CIDS)		
21-1224				IN PROGRESS	VENTILATION - INSTALLATION VENTILATION SYSTEM IN FWD CARGO COMPARTMENT (WITH ENHANCED CIDS)		
21-1235				IN PROGRESS	AIR COOLING - INSTALL OZONE CONVERTER ENGELHARD PN 20499006		
21-1236				IN PROGRESS	AIR COOLING - INSTALL OZONE CONVERTER ENGELHARD PN 20499004 WITH INSULATION COVER		
21-1243				IN PROGRESS	AIR CONDITIONING - CARGO COMPARTMENT - AFT CARGO VENTILATION SYSTEM DEACTIVATION		
21-1245				IN PROGRESS	AIR COOLING - INSTALL VOC/OZONE CATALYTIC CONVERTER FOR A/C WITH A318-TYPE ECS		

SB Number	REV	Vendor	SB Number	Incorporation Status	SB Title	Customer work order	Embodiment status
21-1254				IN PROGRESS	AIR COOLING - INSTALL VOC/OZONE CATALYTIC CONVERTER PN 44018003 FOR A/C WITHOUT A318-TYPE ECS.		
23-1089				IN PROGRESS	COMMUNICATION - CABIN INTERCOMMUNICATION DATA SYSTEM - INTRODUCE MODIFIED DIRECTOR POWER SUPPLY PRINCIPLE		
23-1172				IN PROGRESS	COMMUNICATIONS - PASSENGER ADDRESS SYSTEM - MODIFY EMERGENCY POWER SUPPLY		
23-1211				IN PROGRESS	COMMUNICATIONS - SATCOM - INSTALL TOP MOUNTED AERO H+ SATCOM ANTENNA (CANADIAN MARCONI)		
23-1214				IN PROGRESS	COMMUNICATIONS - EMERGENCY ALERTING SYSTEM - INSTALLATION OF AN EMERGENCY ALERTING SYSTEM		
23-1321				IN PROGRESS	COMMUNICATIONS - PAX FACILITIES-AIR-TO GROUND TELEPHONE - INSTALL A GLOBAL SYSTEM MOBILE PHONE (GSM) ON BOARD		
23-1400				IN PROGRESS	COMMUNICATIONS - CABIN INTERCOMMUNICATION DATA SYSTEM (CIDS) - INSTALL NEW ENHANCED CIDS		
23-1423				IN PROGRESS	COMMUNICATIONS - CABIN INTERCOMMUNICATION DATA SYSTEM (CIDS) - INSTALL ENHANCED CIDS		
23-1424				IN PROGRESS	COMMUNICATIONS - CABIN INTERCOMMUNICATION DATA SYSTEM (CIDS) - INSTALL ENHANCED CIDS		
23-1430				IN PROGRESS	COMMUNICATIONS - CABIN INTERCOMMUNICATION DATA SYSTEM (CIDS) - REMOVE COCKPIT CREW AND CABIN CREW ALERTING SYSTEM		
23-1485				IN PROGRESS	PASSENGER ADDRESS SYSTEM - MODIFY EMERGENCY POWER SUPPLY		
23-1544				IN PROGRESS	CABIN INTERCOMMUNICATION DATA SYSTEM - INTRODUCE MODIFIED DIRECTOR POWER SUPPLY PRINCIPLE		

SB Number	REV	Vendor	SB Number	Incorporation Status	SB Title	Customer work order	Embodiment status
23-1555				IN PROGRESS	PASSENGER ADDRESS SYSTEM - MODIFY EMERGENCY POWER SUPPLY		
23-1569				IN PROGRESS	COMMUNICATIONS - CABIN INTERCOMMUNICATION DATA SYSTEM (CIDS) - REMOVE ANTI HIJACK BUTTON		
24-1011				IN PROGRESS	ELECTRICAL POWER - AC DISTRIBUTION - REVISE NAVIGATION LIGHT POWER SUPPLY		
24-1045				IN PROGRESS	ELECTRICAL POWER - WING ELECTRICS - TO PREVENT CABLE CHAFING AT CONDUITS OUTLETS		
24-1072				IN PROGRESS	ELECTRICAL POWER - COMMON ELECTRICAL INSTALLATION - MODIFY INSTALLATION AND ROUTING IN SECTION 19/POINT Y		
24-1096				IN PROGRESS	ELECTRICAL POWER - AC EMERGENCY GENERATION - ACTIVATE A319/A321 ELECTRICAL EMERGENCY CONFIGURATION ON A320 A/C.		
24-1100				IN PROGRESS	ELECTRICAL POWER - AC-DC MAIN DISTRIBUTION - INSTALL AC-DC SHEDDABLE BUSBARS		
24-1107				IN PROGRESS	ELECTRICAL POWER-GENERAL-CHANGE IFE POWER SUPPLY BUSBARS INTO SHEDDABLE BUSBARS 220XP AND 212PP		
24-1112				IN PROGRESS	ELECTRICAL POWER - GENERAL - INSTALL A COMMERCIAL SHEDDING PUSH-BUTTON SWITCH IN COCKPIT		
24-1137				IN PROGRESS	ELECTRICAL POWER - GENERAL - AC-DC MAIN DISTRIBUTION - INSTALL AC-DC SHEDDABLE BUSBARS		
25-1BBF				IN PROGRESS	EQUIPMENT / FURNISHINGS - LAVATORIES - REPLACE CHEMICAL BY GASEOUS OXYGEN BOXES IN LAVATORIES		
25-1BBG				IN PROGRESS	EQUIPMENT / FURNISHINGS - LAVATORIES - REPLACE CHEMICAL BY GASEOUS OXYGEN BOXES IN LAVATORIES		

SB Number	REV	Vendor	SB Number	Incorporation Status	SB Title	Customer work order	Embodiment status
25-1BBK				IN PROGRESS	EQUIPMENT / FURNISHINGS - LAVATORIES - REPLACE CHEMICAL BY GASEOUS OXYGEN BOXES IN LAVATORIES		
25-1BBM				IN PROGRESS	EQUIPMENT / FURNISHINGS - LAVATORIES - REPLACE CHEMICAL BY GASEOUS OXYGEN BOXES IN LAVATORIES		
25-1BBN				IN PROGRESS	EQUIPMENT / FURNISHINGS - LAVATORIES - REPLACE CHEMICAL BY GASEOUS OXYGEN BOXES IN LAVATORIES		
25-1BBP				IN PROGRESS	EQUIPMENT / FURNISHINGS - LAVATORIES - REPLACE CHEMICAL BY GASEOUS OXYGEN BOXES IN LAVATORIES		
25-1BBQ				IN PROGRESS	EQUIPMENT / FURNISHINGS - LAVATORIES - REPLACE CHEMICAL BY GASEOUS OXYGEN BOXES IN LAVATORIES		
25-1BBR				IN PROGRESS	LAVATORIES - REPLACE CHEMICAL BY GASEOUS OXYGEN BOXES IN LAVATORIES		
25-1BBS				IN PROGRESS	EQUIPMENT / FURNISHINGS - LAVATORIES - REPLACE CHEMICAL BY GASEOUS OXYGEN BOXES IN LAVATORIES		
25-1BBU				IN PROGRESS	EQUIPMENT / FURNISHINGS - LAVATORIES - REPLACE CHEMICAL BY GASEOUS OXYGEN BOXES IN LAVATORIES		
25-1BB0				IN PROGRESS	EQUIPMENT / FURNISHINGS - LAVATORIES - REPLACE CHEMICAL BY GASEOUS OXYGEN BOXES IN LAVATORIES		
25-1BB4				IN PROGRESS	EQUIPMENT/FURNISHING - FWD CARGO COMPARTMENT- CHANGE FROM SEMI AUTO CLS TO FULL BULK CONFIGURATION		
25-1BB5				IN PROGRESS	EQUIPMENT/FURNISHING - AFT CARGO COMPARTMENT- CHANGE FROM SEMI AUTO CLS TO FULL BULK CONFIGURATION		
25-1BB7				IN PROGRESS	CARGO COMPARTMENT - INSTALL A HEATED DRAINAGE SYSTEM ON A321 ON AIRCRAFT WITH CLS		

SB Number	REV	Vendor	SB Number	Incorporation Status	SB Title	Customer work order	Embodiment status
25-1BCD				IN PROGRESS	EQUIPMENT / FURNISHINGS - LAVATORIES - REPLACE CHEMICAL BY GASEOUS OXYGEN BOXES IN LAVATORIES		
25-1BCE				IN PROGRESS	EQUIPMENT / FURNISHINGS - LAVATORIES - REPLACE CHEMICAL BY GASEOUS OXYGEN BOXES IN THE LAVATORIES		
25-1BCP				IN PROGRESS	EQUIPMENT / FURNISHINGS - LAVATORIES - REPLACE CHEMICAL BY GASEOUS OXYGEN BOXES IN THE LAVATORIES		
25-1BCR				IN PROGRESS	EQUIPMENT / FURNISHINGS - LAVATORIES - REPLACE CHEMICAL BY GASEOUS OXYGEN BOXES IN LAVATORIES		
25-1BC0				IN PROGRESS	LAVATORIES - REPLACE CHEMICAL BY GASEOUS OXYGEN BOXES IN LAVATORIES		
25-1BC1				IN PROGRESS	EQUIPMENT / FURNISHINGS - LAVATORIES - REPLACE CHEMICAL BY GASEOUS OXYGEN BOXES IN LAVATORIES		
25-1BC2				IN PROGRESS	LAVATORIES - REPLACE CHEMICAL BY GASEOUS OXYGEN BOXES IN LAVATORIES		
25-1BC3				IN PROGRESS	EQUIPMENT / FURNISHINGS - LAVATORIES - REPLACE CHEMICAL BY GASEOUS OXYGEN BOXES IN LAVATORIES		
25-1BC9				IN PROGRESS	EQUIPMENT / FURNISHINGS - EMERGENCY - REPLACE ESCAPE SLIDES WITH SLIDE RAFTS AND INSTALL VARIOUS EMERGENCY EQUIPMENT		
25-1BHE				IN PROGRESS	EQUIPMENT/FURNISHING - FWD CARGO COMPARTMENT - REMOVAL OF THE CLS AND INSTALLATION OF FULL BULK CAPABILITY		
25-1BHF				IN PROGRESS	AFT CARGO COMPARTMENT - REMOVAL OF THE CLS AND INSTALLATION OF FULL BULK CAPABILITY		
25-1BHK				IN PROGRESS	MISCELLANEOUS EMERGENCY EQUIPMENT - INSTALL LOW FREQUENCY UNDERWATER LOCATOR BEACON (LF-ULB)		

SB Number	REV	Vendor	SB Number	Incorporation Status	SB Title	Customer work order	Embodiment status
25-1BJ0				IN PROGRESS	INSTALL A DEADBOLT LOCKING MECHANISM IN THE REINFORCED COCKPIT DOOR		
25-1BPB				IN PROGRESS	MISCELLANEOUS EMERGENCY EQUIPMENT - INSTALL LOW FREQUENCY UNDERWATER LOCATOR BEACON (LF-ULB)		
25-1BPE				IN PROGRESS	MISCELLANEOUS EMERGENCY EQUIPMENT - INSTALL LOW FREQUENCY UNDERWATER LOCATOR BEACON (LF-ULB)		
25-1BQM				IN PROGRESS	FWD AND AFT CARGO COMPARTMENT - REMOVAL OF HEATED DRAINAGE		
25-1BQW				IN PROGRESS	CARGO - ADAPT AFT CARGO COMPARTMENT FOR ACJ319 NEO WEIGHT REDUCTION (MWE IMPROVEMENT)		
25-1B07				IN PROGRESS	EQUIPMENT / FURNISHINGS - EMERGENCY - REPLACE ESCAPE SLIDES WITH SLIDE RAFTS		
25-1B51				IN PROGRESS	EQUIPMENT / FURNISHINGS - LAVATORIES - REPLACE CHEMICAL BY GASEOUS OXYGEN BOXES IN LAVATORIES		
25-1B52				IN PROGRESS	EQUIPMENT / FURNISHINGS - LAVATORIES - REPLACE CHEMICAL BY GASEOUS OXYGEN BOXES IN LAVATORIES		
25-1B57				IN PROGRESS	EQUIPMENT / FURNISHINGS - LAVATORIES - REPLACE CHEMICAL BY GASEOUS OXYGEN BOXES IN LAVATORIES		
25-1B58				IN PROGRESS	EQUIPMENT / FURNISHINGS - LAVATORIES - REPLACE CHEMICAL BY GASEOUS OXYGEN BOXES IN LAVATORIES		
25-1B64				IN PROGRESS	EQUIPMENT / FURNISHINGS - LAVATORIES - REPLACE CHEMICAL BY GASEOUS OXYGEN BOXES IN LAVATORIES		
25-1B78				IN PROGRESS	EQUIPMENT / FURNISHINGS - LAVATORIES - REPLACE CHEMICAL BY GASEOUS OXYGEN CONTAINER IN LAVATORIES		

SB Number	REV	Vendor	SB Number	Incorporation Status	SB Title	Customer work order	Embodiment status
25-1B97				IN PROGRESS	EQUIPMENT / FURNISHINGS - LAVATORIES - REPLACE CHEMICAL BY GASEOUS OXYGEN BOXES IN LAVATORIES		
25-1B98				IN PROGRESS	EQUIPMENT / FURNISHINGS - LAVATORIES - REPLACE CHEMICAL BY GASEOUS OXYGEN BOXES IN LAVATORIES		
25-1B99				IN PROGRESS	EQUIPMENT / FURNISHINGS - EMERGENCY - REPLACE ESCAPE SLIDES WITH SLIDE RAFTS AND INSTALL VARIOUS EMERGENCY EQUIPMENT		
25-1055				IN PROGRESS	EQUIPMENT/FURNISHINGS - ESCAPE FACILITIES - INSTALL AIR CRUISERS SLIDE RAFTS AT THE PASSENGER/CREW DOORS		
25-1075				IN PROGRESS	EQUIPMENT/FURNISHINGS - CARGO COMPARTMENT - INSTALL CARGO DRAINAGE		
25-1134				IN PROGRESS	XP A320_200 CARGO LOADING SYSTEM PART A : BULK LOADING CONFIGURATION TO CLS CONFIGURATION		
25-1135				IN PROGRESS	XP A320_200 CARGO LOADING SYSTEM PART B : CLS CONFIGURATION TO BULK LOADING CONFIGURATION		
25-1136				IN PROGRESS	XF A320_200 CARGO LOADING SYSTEM PART A : BULK LOADING CONFIGURATION TO CLS CONFIGURATION		
25-1183				IN PROGRESS	EQUIPMENT/FURNISHINGS - PASSENGER COMPARTMENT - MODIFY CABIN FROM 172 PAX TO 159 PAX		
25-1218				IN PROGRESS	EQUIPMENT/FURNISHINGS - EMERGENCY EQUIPMENT - INSTALL AIR CRUISERS SLIDE RAFTS AT PASSENGER/CREW DOORS ON A321 AIRCRAFT		
25-1239				IN PROGRESS	EQUIPMENT/FURNISHING - PASSENGER COMPARTMENT - CONVERT THE CABIN LAYOUT FROM THE PRESENT ALL TOURIST CLASS CONFIGURATION TO A BUSINESS/TOURIST CLASS CONFIGURATION		

SB Number	REV	Vendor	SB Number	Incorporation Status	SB Title	Customer work order	Embodiment status
25-1257				IN PROGRESS	EQUIPMENT/FURNISHINGS - PASSENGER COMPARTMENT - INSTALL THE BASELINE ELECTRICAL COMPONENTS AND EQUIPMENT/FURNISHINGS ON AN A319 CORPORATE JET		
25-1258				IN PROGRESS	EQUIPMENT/FURNISHINGS - PASSENGER COMPARTMENT - INSTALL THE STRUCTURAL/ELECTRICAL PROVISIONS AND THE SLIDE RAFTS FOR THE BASELINE MODIFICATION ON AN A319 CORPORATE JET		
25-1289				IN PROGRESS	EQUIPMENT/FURNISHINGS - FORWARD LAVATORIES - INSTALL A SIDEWALL MADE OF NEW HONEYCOMB MATERIAL AT LAVATORY A		
25-1304				IN PROGRESS	EQUIPMENT/FURNISHINGS - CARGO COMPARTMENT - INSTALL A HEATED DRAINAGE SYSTEM ON A321		
25-1314				IN PROGRESS	EQUIPMENT/FURNISHING - LAVATORIES - MODIFICATION OF THE FLOOR PAN		
25-1319				IN PROGRESS	EQUIPMENT/FURNISHINGS - CARGO COMPARTMENT- INSTALL A HEATED DRAINAGE SYSTEM ON A319		
25-1321				IN PROGRESS	EQUIPMENT/FURNISHINGS - LAVATORIES - INSTALL AN ADDITIONAL LAVATORY D		
25-1335				IN PROGRESS	EQUIPMENT/FURNISHINGS - PASSENGER COMPARTMENT - INSTALLATION OF SLIDE RAFTS ON A319 AIRCRAFT		
25-1357				IN PROGRESS	EQUIPMENT/FURNISHINGS - FORWARD LAVATORIES - INSTALL A SIDEWALL MADE OF NEW HONEYCOMB MATERIAL AT LAVATORY F		
25-1400				IN PROGRESS	EQUIPMENT/FURNISHINGS - CURTAINS AND PARTITIONS - INSTALL A DEADBOLT IN THE REINFORCED COCKPIT DOOR		
25-1419				IN PROGRESS	EQUIPMENT/FURNISHINGS - EMERGENCY EQUIPMENT - INSTALL SLIDE RAFTS AT THE PASSENGER/CREW DOORS		
25-1421				IN PROGRESS	EQUIPMENT/FURNISHINGS - LAVATORIES - INTRODUCE MODIFIED HONEYCOMB MATERIAL FOR LAVATORIES D AND E		

SB Number	REV	Vendor	SB Number	Incorporation Status	SB Title	Customer work order	Embodiment status
25-1497				IN PROGRESS	EQUIPMENT/FURNISHINGS-LAVATORIES- INTRODUCE MODIFIED HONEYCOMB MATERIAL FOR LAVATORIES D AND E		
25-1557				IN PROGRESS	EQUIPMENT/FURNISHING - FORWARD FUSELAGE EQUIPMENT - REINFORCE 80VU SUPPORTS FITTINGS.		
25-1650				IN PROGRESS	EQUIPMENT/FURNISHINGS - CURTAINS AND PARTITIONS - INSTALL A DEADBOLT IN THE REINFORCED COCKPIT DOOR		
25-1692				IN PROGRESS	EQUIPMENT / FURNISHINGS - EMERGENCY - REPLACE ESCAPE SLIDE WITH SLIDE RAFT		
25-1734				IN PROGRESS	EQUIPMENT / FURNISHINGS - PASSENGER COMPARTMENT - CHANGE CABIN CONFIGURATION TO 12 BUSINESS CLASS AND 102 TOURIST CLASS SEATS AND INSTALL THALES I4000 IN-FLIGHT ENTERTAINMENT (IFE)		
25-1754				IN PROGRESS	EQUIPMENT/FURNISHINGS - LAVATORIES MODIFICATION OF FLOOR PAN		
25-1789				IN PROGRESS	EQUIPMENT / FURNISHINGS - CURTAINS AND PARTITIONS - INSTALL DEADBOLT IN THE REINFORCED COCKPIT DOOR		
25-1820				IN PROGRESS	CURTAINS AND PARTITIONS - INSTALL DEADBOLT IN THE REINFORCED COCKPIT DOOR		
26-1017				IN PROGRESS	FIRE DETECTION - LAVATORY SMOKE DETECTION - INTRODUCE AMBIENT SYSTEM		
26-1019				IN PROGRESS	FIRE PROTECTION - MODIFY LAVATORY WASTE BIN FIRE EXTINGUISHER INSTALLATION		
26-1020				IN PROGRESS	FIRE PROTECTION - FWD/AFT CARGO COMPARTMENT - INSTALL A FIRE EXTINGUISHING SINGLE-SHOT SYSTEM		
26-1021				IN PROGRESS	FIRE PROTECTION - FWD/AFT AND BULK CARGO COMPARTMENTS - INSTALL SMOKE DETECTION SYSTEM		

SB Number	REV	Vendor	SB Number	Incorporation Status	SB Title	Customer work order	Embodiment status
26-1024				IN PROGRESS	FIRE PROTECTION - CARGO COMPARTMENT FIRE EXTINGUISHING - INSTALL A FLOW METERING SYSTEM AND AN EXTINGUISHING BOTTLE FOR ETOPS.		
26-1048				IN PROGRESS	FIRE PROTECTION - FWD/AFT CARGO COMPARTMENT - INSTALL SINGLE SHOT SYSTEM		
26-1049				IN PROGRESS	FIRE PROTECTION - FWD/AFT CARGO COMPARTMENT - INSTALL SMOKE SYSTEM		
26-1052				IN PROGRESS	FIRE PROTECTION - AVIONICS COMPARTMENT SMOKE DETECTION - INSTALL AN OPTICAL SMOKE DETECTOR		
26-1055				IN PROGRESS	FIRE PROTECTION - CARGO COMPARTMENT FIRE EXTINGUISHING - INSTALL A FLOW METERING SYSTEM AND AN EXTINGUISHING BOTTLE FOR ETOPS		
26-1064				IN PROGRESS	FIRE PROTECTION - CARGO COMPARTMENT FIRE EXTINGUISHING - INSTALL A FLOW METERING SYSTEM AND A SECOND BOTTLE FOR ETOPS 180 MIN (CORPORATE JET)		
26-1065				IN PROGRESS	FIRE PROTECTION - CARGO COMPARTMENT FIRE EXTINGUISHING - INSTALL A FLOW METERING SYSTEM AND AN EXTINGUISHING BOTTLE FOR ETOPS		
26-1069				IN PROGRESS	FIRE PROTECTION - CARGO COMPARTMENT FIRE EXTINGUISHING - INTRODUCE A FIRE EXTINGUISHING SYSTEM FOR ETOPS 180 MIN		
26-1070				IN PROGRESS	FIRE PROTECTION - FWD/AFT AND BULK CARGO COMPARTMENTS - INSTALL SMOKE DETECTION SYSTEM		
26-1071				IN PROGRESS	FIRE PROTECTION - FWD/AFT CARGO COMPARTMENT - INSTALL A FIRE EXTINGUISHING SINGLE-SHOT SYSTEM		
26-1076				IN PROGRESS	CARGO COMPARTMENT FIRE EXTINGUISHING - INSTALL FIRE BOTTLE FOR ETOPS 120 IN AFT CC ON A319 A/C		

SB Number	REV	Vendor	SB Number	Incorporation Status	SB Title	Customer work order	Embodiment status
26-1077				IN PROGRESS	CARGO COMPARTMENT FIRE EXTINGUISHING - RELOCATE BASIC FIREX BOTTLE, FLOW METER FOR ETOPS AND INSTALL SECOND FIRE EXTINGUISHER BOTTLE		
26-1080				IN PROGRESS	CARGO COMPARTMENT FIRE EXTINGUISHING - INSTALL A FLOW METERING SYSTEM AND AN EXTINGUISHING BOTTLE FOR ETOPS		
26-1082				IN PROGRESS	CARGO COMPARTMENT FIRE EXTINGUISHING - INSTALL 2ND FIRE EXTINGUISHING BOTTLE FOR ETOPS 120/180 ON A320 AIRCRAFT		
26-1085				IN PROGRESS	FIRE PROTECTION - CARGO COMPARTMENT FIRE EXTINGUISHING - INTRODUCE A FIRE EXTINGUISHING SYSTEM FOR ETOPS 180 MIN		
26-1086				IN PROGRESS	FIRE PROTECTION - CARGO COMPARTMENTS - INSTALL SMOKE DETECTION SYSTEM IN FWD CARGO COMPARTMENT		
26-1089				IN PROGRESS	FIRE PROTECTION - CARGO COMPARTMENT - INSTALL A FIRE EXTINGUISHING SYSTEM FOR ETOPS 180 MIN FOR A319 CJ		
26-1092				IN PROGRESS	CARGO COMPARTMENTS - INSTALL SINGLE SHOT FIRE EXTINGUISHING SYSTEM ON CARGO COMPARTMENT		
26-1093				IN PROGRESS	A320 - FIRE PROTECTION - INSTALL SMOKE DETECTION IN FWD CARGO COMPARTMENT		
26-1094				IN PROGRESS	CARGO COMPARTMENT FIRE EXTINGUISHING - INSTALL A FLOW METERING SYSTEM AND AN EXTINGUISHING BOTTLE FOR ETOPS		
26-1098				IN PROGRESS	FIRE PROTECTION - FWD CARGO COMPARTMENT - INSTALL SMOKE DETECTION AND SINGLE SHOT FIRE EXTINGUISHING SYSTEM IN FWD CARGO COMPARTMENT		
26-1099				IN PROGRESS	CARGO COMPARTMENT FIRE EXTINGUISHING - RELOCATE BASIC FIREX BOTTLE, FLOW METER FOR ETOPS AND INSTALL SECOND FIRE EXTINGUISHER BOTTLE		

SB Number	REV	Vendor	SB Number	Incorporation Status	SB Title	Customer work order	Embodiment status
26-1100				IN PROGRESS	FIRE PROTECTION - CARGO COMPARTMENT FIRE EXTINGUISHING - INTRODUCE A FIRE EXTINGUISHING SYSTEM FOR ETOPS 180 MIN		
26-1101				IN PROGRESS	CARGO COMPARTMENT FIRE EXTINGUISHING - RELOCATE BASIC FIREX BOTTLE, FLOW METER FOR ETOPS AND INSTALL SECOND FIRE EXTINGUISHER BOTTLE		
27-1057				IN PROGRESS	FLIGHT CONTROLS - AILERONS - ELIMINATE EXCESSIVE PLAY ON AILERON TRAILING EDGE AND REVISE TORQUE VALUE FOR BOLTS		
27-1070				IN PROGRESS	FLIGHT CONTROLS - FCDC SYSTEM - INTRODUCE THE A320/A321 FCDC STANDARD		
27-1077				IN PROGRESS	FLIGHT CONTROL - FLAPS - INTRODUCE MODIFIED SEALING ON FLAP ACTUATORS (A320)		
27-1091				IN PROGRESS	FLIGHT CONTROL - FLAPS - INTRODUCE MODIFIED SEALING ON FLAP ACTUATORS (A321)		
27-1106				IN PROGRESS	FLIGHT CONTROLS - FLAPS - INTRODUCE SEMI-FLUID LUBRICATION TO OFFSET GEARBOX AND INTRODUCE MODIFIED ROTARY ACTUATOR SEAL		
27-1110				IN PROGRESS	FLIGHT CONTROLS - AILERON HYDRAULIC ACTUATION - INSTALLATION OF IMPROVED TYPE OF NMB BEARINGS		
27-1117				IN PROGRESS	FLIGHT CONTROLS - FLAPS - MODIFY SLIDING PANEL DRIVING MECHANISM		
27-1120				IN PROGRESS	FLIGHT CONTROL - FCDC SYSTEM - INTRODUCE FCDC P/N -0106.		
27-1138				IN PROGRESS	FLIGHT CONTROLS - FLAP HYDRAULIC ACTUATION AND POWER TRANSMISSION - REDESIGN FLAP ACTUATOR		
27-1222				IN PROGRESS	FLIGHT CONTROLS - THS HYDRAULIC ACTUATION - INSTALL THSA WITH NEW BALLSCREW ANTI-CORROSION PROTECTION AND SPECIAL DRAINING NUT		

SB Number	REV	Vendor	SB Number	Incorporation Status	SB Title	Customer work order	Embodiment status
27-1223				IN PROGRESS	FLIGHT CONTROLS-ELEVATOR AND HYDRAULIC ACTUATION-INTRODUCE ROLLER BEARING ON ROD END ELEVATOR SERVOCONTROL		
27-1248				IN PROGRESS	THS HYDRAULIC ACTUATION - ACTIVATE ELECTRICAL LOAD SENSING DEVICE (ELSD) ON SA THS ACTUATOR		
27-1902				IN PROGRESS	FLIGHT CONTROLS - AILERON SERVO CONTROLS - EVALUATION OF DIFFERENT TYPES OF SPHERICAL BEARINGS.		
28-1005				IN PROGRESS	FUEL - FQIC SOFTWARE 05 UP DATE		
28-1071				IN PROGRESS	FUEL - FQIC - INTRODUCE FQIC (SIMMONDS) WITH VERSION 6.1 SOFTWARE		
28-1073				IN PROGRESS	FUEL - TANKS - REINSTALLATION/FLIGHT WITH ADDITIONAL CENTER TANK		
28-1080				IN PROGRESS	FUEL - TANKS - REMOVAL/INSTALLATION OF ADDITIONAL CENTER TANK		
28-1090				IN PROGRESS	FUEL - TANKS - REMOVAL/INSTALLATION OF ADDITIONAL CENTER TANKS		
28-1091				IN PROGRESS	FUEL - TANKS - REMOVAL/INSTALLATION OF ONE ADDITIONAL CENTER TANK		
28-1110				IN PROGRESS	FUEL - TANKS - INSTALLATION/REMOVAL ON A321 OF ONE ACT IN AFT CARGO HOLD ON CLS CONFIGURATION WITH FULL BULK CAPABILITY AND FULL PROVISIONS FOR ONE ACT		
28-1115				IN PROGRESS	FUEL - REMOVAL/INSTALLATION OF ADDITIONAL CENTER TANKS ON A321 WITH CARGO LOADING SYSTEM		
28-1118				IN PROGRESS	FUEL - TANKS - INSTALL ONE ACT PROVISION ON A320 WITH CLS		
28-1126				IN PROGRESS	FUEL - TANK - INSTALL/REMOVE ONE ACT IN AFT CARGO COMPARTMENT WITH SEMI-AUTO CLS CONFIGURATION		

SB Number	REV	Vendor	SB Number	Incorporation Status	SB Title	Customer work order	Embodiment status

92-1009				IN PROGRESS	ELECTRICAL AND ELECTRONIC COMMON INSTALLATION - ACT WIRING - IMPROVEMENT OF ROUTING AND PROTECTION.		

SYSTEMS, APU AND POWER PLANT

1. GENERAL

This section includes all scheduled maintenance tasks related to the aircraft systems including the tasks for power plants (accessories, engine mounts, cowlings and thrust reverser) and auxiliary power unit (Honeywell {formerly GARRETT} GTCP 36-300, Honeywell {formerly ALLIED SIGNAL} 131-9(A) and APIC APS 3200).

NOTE: Zonal inspections and structural inspections of powerplant are provided in Section 3 and 4 of this MPD respectively.

Shop maintenance tasks (off-wing) may not be included in the A320 FAMILY MPD.

With respect to the evaluation procedures and the resulting tasks the following is noted:

A. Safe Life Airworthiness Limitation Items are published in Part 1 of the Airworthiness Limitation Section (ALS). The ALS is available online.

B. Limitations of life limited parts are controlled and published in the following documents:
   - Airbus A320 FAMILY Airworthiness Limitation Section (ALS) Parts 1, 4 and 5
   - CFM 56-5 Engine Shop Manual Chapter 5
   - CFM LEAP-1A Engine Shop Manual Chapter 5
   - IAE V2500 Engine Manual Chapter 5
   - PW6000 Series Engine Manual Chapter 5
   - PW1100G Airworthiness Limitations Manual PN 5316993
   - Garrett GTCP 36-300 Engine Component Maintenance Manual
   - P&WC APS 3200 Component Maintenance Manual
   - Allied Signal 131-9(A) Engine Manual

C. Category II/III landing capabilities and RVSM capability are inherent functions of the basic design standard of the aircraft. Scheduled tasks necessary for these operations have been considered in the development of this program. Operators should comply with National Requirements as applicable.

D. For systems tasks arising from MSG-3 logic, Failure Effect Categories (FEC) depending on the consequence of failure are given in this section against each task for information:
   - FEC 5 : Evident Safety Effects
   - FEC 6 : Evident Operational Effects
   - FEC 7 : Evident Economic Effects
   - FEC 8 : Hidden Function Safety Effects
   - FEC 9 : Hidden Function Non-Safety Effects

   The notation "-" (hyphen) in the FEC column indicates that the task has not been developed through the MSG-3 systems logic. They may result from specific airworthiness authorities request.

E. When more than one interval figure is assigned to a task, and when not stated otherwise, the interval expiring first shall apply.

F. Tasks arising from the Enhanced Zonal Analysis Procedure (EWIS), (comprised of GVI tasks not fully covered by Zonal tasks and DI/RS tasks) are included within ATA chapter 20 and have no Failure Effect Category (FEC) quoted. The tasks are identified with "(EWIS)" following the task description and with "MRB " in the source column of MPD.

NOTE: ATA 20 tasks (with the identifier "EWIS") must not be deleted from the operators maintenance program.

G. Tasks associated with the ignition prevention features of all systems are identified MSI 28-18-00 Ignition Prevention. The tasks are identified with "(SFAR88)" following the task description.

H. No recommendation is made for scheduled fuel analysis. Operators who suspect the quality of their fuel supplies or who operate in an environment known to promote microbiological growth are recommended to introduce fuel sampling and consider the use of additives to minimize the potential for such growth.

I. Contamination of vacuum waste lines is highly related to operational conditions. Typical parameters that determine contamination inside waste lines are potable water quality, flight length, catering service etc. These parameters significantly vary among operators and therefore the operator should establish the appropriate waste line cleaning tasks and their interval based upon the operating environment, experience and reliability of the waste system. Further details and advice can be found in ISI 38.31.00030.

J. This section identifies some tasks with intervals less than 750 FH or 4 MO (i.e. A-check equivalent). These have been developed using the MSG-3 process and should be included in routine checks. With the exception of any task with CMR status, those tasks which are typical for all aircraft types may be scheduled by the operator in accordance with Regulatory Authority accepted standard practices, the quoted interval being given for the guidance of operators who do not have appropriate standards.

K. Lubrication requirements specified in this MPD do not represent the total lubrication provisions for the aeroplane. Accordingly, operators should refer to the manufacturer's appropriate maintenance publications for additional lubrication information.

L. For Powerplant and APU the following notes apply:

1. Shop maintenance tasks ("off-wing") are not mentioned in the APU and Power Plant Chapters.
2. Operators should take the opportunity of the engine or APU removals and disassembly in workshop, to perform the inspection and restoration tasks specified in the engine or APU shop manuals.
3. These tasks are not considered as scheduled maintenance in the A320 FAMILY MPD
4. No threshold or opportunity inspection requirements are given for APU and power plant. Manufacturers may recommend such inspections in the event that late development or early in-service experience would indicate the desirability to examine specific components of individual engines. If this is necessary, then direct negotiations between applicable operators and the power plant manufacturer will be arranged. Results of these inspections are to be made available by the manufacturers to other customer airlines as well as the Regulatory Authorities
5. The manufacturer reserve the right to define additional inspection tasks, with threshold and, if necessary, repeat interval in the event that late developments or early in-service experience dictate the need to check the condition of specific components on certain engines. If this proves necessary, direct negotiations between the operators concerned and the engine or APU manufacturer will be arranged.
6. Results of these inspections shall be communicated by the engine or APU manufacturer to the other A320 FAMILY operators concerned and to the Regulatory Authorities

2. NOTES

NOTES 1 to 14 and 16 to 28: Contents of MRBR Section C Notes 1 thru 14 and 16 to 28 are given as full text to the appropriate tasks in the MPD.

NOTE 15: Operational check, per operator's fleet, in accordance with the following sampling schedule:

A318/A319/A320 fleet

DOOR / EXIT	QUANTITY	INTERVAL
FWD PASSENGER / CREW DOOR	1	Not to exceed 36 MO
AFT PASSENGER DOOR / CREW DOOR	1	Not to exceed 36 MO
EMERGENCY EXIT HATCHES	1	Not to exceed 36 MO

A321 fleet

DOOR / EXIT	QUANTITY	INTERVAL
FWD PASSENGER / CREW DOOR	1	Not to exceed 36 MO
AFT PASSENGER DOOR / CREW DOOR	1	Not to exceed 36 MO
FWD EMERGENCY EXIT DOOR	1	Not to exceed 36 MO
AFT EMERGENCY EXIT DOOR	1	Not to exceed 36 MO
EMERGENCY EXIT HATCHES	1	Not to exceed 36 MO

Checks may be performed on either side and do not all have to be performed on the same aircraft. As an ongoing continuous maintenance program the operator should continue the operational check sequence until the schedule has been revised by the MRB. Inadvertent deployments may not be used to satisfy the above requirement. A318/A319/A320/A321 fleets can be combined for common doors.

NOTE 29: Tasks identified with Note 29 in the MRBR are to be managed at component level. In these cases, the interval is to be counted from the manufacturing date of the component or from date of previous task accomplishment on the component. Where an expiry date is applied by the vendor, the operator may seek agreement from local NAA to change the expiry date to reflect the MRBR task interval and thus avoid giving the impression that the component has been left in service beyond the approved period. The requirement to manage intervals at component level does not necessarily lead to serialization of these components. Other means such as electronic tagging or bar coding may be used as an alternative

TASK NUMBER	ZONE	DESCRIPTION	SAMPLE THRESHOLD (ST) SAMPLE INTERVAL (SI) THRESHOLD (T) INTERVAL (I)	SOURCE	REFERENCE	MEN	M/H	APPLICABILITY

STRUCTURE

1. GENERAL

This section provides the basic scheduled maintenance tasks and frequencies applicable to the aircraft structure.

The purpose of this section is to maintain the continuous airworthiness of the aircraft structure and to control corrosion to Level 1 or better (ref: § 7. CORROSION PREVENTION AND CONTROL PROGRAM for definition of Level 1 corrosion).

2. INSPECTION PHILOSOPHY

This section has been developed by considering the different sources of damage depending on the materials used.

A. Metallics

- Fatigue Damage (FD).
- Environmental Deterioration (ED).
- Accidental Damage (AD).

Fatigue Damage

For FD, the damage initiation and subsequent damage growth is primarily dependent on the ground - air-ground loading variation, which occurs once per flight. Therefore, flight cycles (FC) are used as the unit for thresholds and repeat intervals. Some fatigue related SSIs are also sensitive to flight duration. For these SSIs, a FH limit is stated in addition to the FC limit. The inspection is to be performed at whichever limit is reached first.

The structure inspection tasks selected for fatigue are derived from damage tolerance evaluation according to the criteria defined by FAR/JAR 25.571, Amendment 45, with the aim of ensuring timely damage detection. The FC and FH data is based on a combination of calculation, full-scale fatigue test teardown results, and in-service experience (where available).

Environmental Deterioration

For ED, since the deterioration caused by the environment (e.g. corrosion, stress corrosion) is mainly time dependant, inspection intervals and thresholds are based on calendar time (Years).

Accidental Damage

For deterioration caused by accidental damage, it is considered that major damage such as that caused by bird impact, or ground handling equipment, will be detected by routine inspections.

AD consists of minor damage which could result in fatigue and/or corrosion damage, and which could propagate undetected. In the analysis, the fatigue and environmental effects of the accidental damage are considered. A dedicated AD task is not selected; the AD requirement is consolidated into either the ED or the FD task, or both, according to the AD consequences. AD is therefore subject to maintenance requirements expressed in FC (and FH) or calendar time or both.

B. Non-Metallics

- Ageing Deterioration
- Accidental Damage

Ageing Deterioration

Deterioration caused by ageing considers loading conditions and environmental conditions. Inspection intervals and thresholds are based on calendar time.

Accidental Damage

Deterioration caused by accidental damage is subject to inspection intervals based on calendar time.

The frequency of inspection is dependant on static strength reduction caused by the selected damage, combined with the likelihood of the selected damage occurring more than once during the basic interval.

As this kind of deterioration is random in nature, inspections shall be applied to all aircraft at each repeat interval without threshold.

3. INSPECTION LEVELS

According to the analysis procedure, for each Structural Significant Item (SSI), various inspection levels have been considered with the aim of selecting the lowest inspection level compatible with the type of damage and the expected damage growth. Therefore, one or more of the following inspection levels have been selected for each SSI:

General Visual Inspection (GVI)

Detailed Inspection (DET)

Special Detailed Inspection (SDI)

4. ZONAL TASK (ZIP) COMPATIBILITY

When General Visual Inspection (GVI) level has been selected for a particular structure inspection task in the Structure Section of the MRBR, the inspection requirement is considered adequately covered by the equivalent Zonal tasks which are referenced in the ZIP reference column. The MRB Report Structure Section GVI tasks, which have a ZIP reference, are therefore not listed as individual tasks in the MPD.

GVI maintenance tasks which are not compatible with the Zonal Section are stated in the MPD as individual tasks. GVI SSI's which also require the addition of Temporary Protection Systems (TPS) will still be indicated as individual tasks in the Structures Section of the MPD. The TPS application remains a Structures requirement but the inspection part of the maintenance task may be covered by the Zonal Inspection.

GVI requirements which are also ALI requirements must not be transferred to the ZIP and are therefore listed as individual tasks.

Refer to paragraph 4 of the introduction of the A320 FAMILY MRBR Structure Section for additional details.

5. INSPECTION CATEGORIES

A. INTRODUCTION

Structure inspections fall into the following two categories:

– 100% Tasks with no associated Sampling Task,

– and Sampling Tasks that become 100% for the non sampling aircraft at the 100% Threshold.

The inspections performed on sampling fleet aircraft prevent performing the sampling inspections on 100% of one operator's fleet at the listed sampling threshold as per task.

In case an operator does not define a sampling fleet, it is the Airbus recommendation to perform applicable sampling inspection requirements on all aircraft of the operator's fleet.

B. 100% TASKS WITH NO ASSOCIATED SAMPLING TASK

These are:

- Fatigue tasks where calculation and/or test indicate a high fatigue sensitivity which are however, not classified as ALI. These tasks are not selected for Sampling. These tasks have a 100% Threshold only e.g. 551002-01-2
- Fatigue or Environmental Deterioration (corrosion or ageing) tasks where Accidental Damage is likely. These tasks are not selected for Sampling. These tasks have a 100% Threshold only e.g. 534135-01-4

100% Tasks are indicated as follows:

- pdf file: by an entry in the "THRESHOLD INTERVAL" column. The 100% threshold is indicated by "T", the 100% interval is indicated by "I" e.g. 531163-01-1
- Excel table: by an entry in the "100% THRESHOLD" AND "100% INTERVAL" columns only, i. e. no entry in "SAMPLE THRESHOLD" and "SAMPLE INTERVAL" field.
  Example: Task 531163-01-1

100 % tasks must be performed on all aircraft of the fleet, regardless their sample status.

C. SAMPLING TASKS THAT BECOME 100%

These are:

- Corrosion tasks where in-service experience indicates that damage is not likely are selected for sampling. These tasks have a Sampling Threshold and a 100% Threshold. All aircraft not inspected as sampling aircraft must be inspected at the 100% Threshold Example: 574304-01-1.

Sampling tasks that become 100% are indicated as follows:

- pdf file: by an entry in the "THRESHOLD INTERVAL" column. The sampling threshold is indicated by "ST", the sampling interval is indicated by "SI". The 100% threshold is indicated by "T", the 100% interval is indicated by "I" e.g. 534111-01-1
- Excel file: by an entry in the "SAMPLING THRESHOLD" and "SAMPLING INTERVAL" column and an entry in the "100% THRESHOLD" and "100% INTERVAL" column. Example: 534111-01-1

For the selected Sampling Program aircraft, inspections commence at the Sampling Threshold. Repetitive inspections have to be performed at every Sampling Interval (counting from the date of the threshold / previous inspection).

On aircraft not selected for the Sampling Program, the 100% Threshold is the first time when a task has to be performed.

NOTE: The inspection is not required to be repeated when a sampling fleet aircraft reaches the 100% threshold and a sampling requirement of the task was already performed on this

aircraft. Compliance to the 100% inspection requirement is shown with the accomplishment of sampling task inspections for the sampling threshold and follow up intervals.

D. ARRANGEMENT OF INSPECTION REQUIREMENTS

The table below illustrates which category of tasks need to be performed on aircraft depending on their status (sampling fleet versus non sampling fleet).

In case a task includes both sampling and non-sampling requirements, the evaluation of inspection requirements has to be performed for calendar task requirements (YE) and for utilsation parameter (FC / FH) requirements. The “whatever occurs first” rule applies.

NOTE: To ensure that operators do not miss 100% requirements on sampling aircraft, the 100% values have been added to the Sampling requirement in these cases.

Inspection requirements	**Sampling fleet**	**Non sampling fleet**	Entire fleet (If no sampling fleet defined)
100% TASKS WITH NO ASSOCIATED SAMPLING TASK	100% requirement applicable	100% requirement applicable	100% requirement applicable
SAMPLING TASKS WITH A 100% REQUIREMENT	Sampling or 100% requirement applicable (whatever comes first)	100% requirement applicable	Sampling or 100% requirement applicable (whatever comes first)
SAMPLING TASKS WITHOUT A 100% REQUIREMENT	Sampling requirement applicable	Not applicable	Sampling requirement applicable

6. SAMPLING PROGRAM

A. INTRODUCTION

The purpose of the Sampling Program is to detect systematic deterioration caused by the environment, on a group of aircraft selected from those which have the highest age within a considered fleet. The Sampling Program is applicable to Environmental Deterioration (ED) SSIs, where the deterioration, should it occur, is considered as being progressive with age. Only those SSIs for which a systematic environmental deterioration characteristic has been analyzed will be considered for inclusion in the Sampling Program.

SSIs which are susceptible to Accidental Damage (AD, Non-systematic) are not considered for the Sampling Program.

Sampling Program inspections are to monitor environmental circumstances of one operator. The 100% threshold of a sampling task provides information about the inspection point for aircraft that are not part of the sampling fleet.

All aircraft being part of the sampling fleet are continuously inspected in advance of the rest of the fleet at the sampling inspection threshold and afterwards following the sampling interval inspection requirement.

Example 1:

Sampling inspection requirement with 100% threshold (CPCP)

MPD Task 535151-01-1:

- Sampling threshold 12 YE; sampling interval 12 YE;

- 100% threshold 24 YE, 100 % interval 12 YE

Sampling fleet aircraft inspection dates:

First inspection at 12 YE, repetitive inspection 12 YE after first inspection performed (24 YE, 36 YE…)

Non sampling fleet aircraft (sampling fleet installed):

First inspection at 24 YE, repetitive inspection 12 YE after first inspection performed (36 YE, 48 YE…)

Example 2:

Sampling inspection requirement with 100% threshold (ALI)

MPD Task 533105-01-6:

- Sampling threshold 12 YE (MRBR) OR 13100 FC (ALI) OR 56400 FH (ALI); sampling interval 6 YE (MRBR) OR 9000 FC (ALI) OR 38700 FH (ALI);

- 100% threshold 24 YE (MRBR) OR 13100 FC (ALI) OR 56400 FH (ALI), 100% interval 6 YE (MRBR) OR 9000 FC (ALI) OR 38700 FH (ALI)

Sampling fleet aircraft inspection dates:

First inspection at 12 YE OR 13100 FC OR 56400 FH, repetitive inspection every 6 YE OR 9000 FC OR 38700 FH after first inspection performed (whatever comes first).

Non sampling fleet aircraft (sampling fleet installed):

First inspection at 24 YE OR 13100 FC OR 56400 FH, repetitive inspection every 6 YE OR 9000 FC OR 38700 FH after first inspection performed (whatever comes first).

Based on the results of Sampling Program inspections the following applies:

- In case of findings each operator should take appropriate corrective actions, such as change of program concept, decrease in interval, application of TPS etc.
- In case of no finding, the current inspections continue to apply.

The following should be considered by the operator:

1. The inspections performed on sampling fleet aircraft prevent performing the inspections on 100% of one operator's fleet.
2. In case an operator wishes not to define a sampling fleet, it is the AIRBUS recommendation to consider applicable sampling inspection requirements as 100% MRBR inspections, i.e. they should be performed on all aircraft of the operator's fleet.
3. 100% inspection tasks not showing a sampling requirement are applicable for sampling fleet aircraft, too.

With regard to additional inspection requirements that might be applicable for one task, the "whatever appears first" rule apply.

B. SELECTION OF AIRCRAFT FOR SAMPLING PROGRAM

For Sampling Program, a number of aircraft have to be determined as sampling aircraft, at the level of each operator.

For each operator, the Sampling Program aircraft will be the oldest 1/5 aircraft, in the operators fleet, in years.

The oldest aircraft are defined as the aircraft with the highest age in years since their initial manufacturer's delivery date. Operators with a mix of A318, A319, A320 and A321 aircraft can consider this as a combined fleet for the purpose of sample aircraft selection.

If the number of aircraft selected is not a whole number, the number can be decreased to the next lower whole number. The minimum sample size is one aircraft. The maximum number of aircraft to be sampled is 5 aircraft even if the total fleet size would lead to a higher number applying the 20% rule.

NOTE: A group of operators may, if operating in similar operational conditions and having established common rules acceptable to each operators' Airworthiness Authorities may combine their fleets to form one fleet for the Sampling Program.

NOTE: If the operational conditions within an operator's fleet differ significantly (e.g. a sub-fleet is permanently based in a different climate condition) it is advisable to consider dedicated sample aircraft for this sub-fleet.

Any significant changes to an operators fleet will require a review of the Sampling Program air craft. This includes buying and/or selling aircraft and retiring aircraft from the fleet.

Regarding rearranging of the sample fleet the following rules apply:

- The above statements regarding sample size apply.
- Any aircraft in a fleet is protected by the respective sample aircraft of this operator's fleet. If a "non-sampling" aircraft would be integrated into a new operator's fleet it could become a sampling aircraft. However, no retroactive maintenance is required i.e. all inspections are to be performed at their next due.
- The inspection date could be calculated taking into account the last maintenance visit where a sampling inspection would have been performed if the A/C had been part of the sampling fleet.

– Example: An aircraft, which was not a sample A/C, is 7 years old has been acquired by another operator. “100% concept” 6 YE threshold inspection requirements have been accomplished during a maintenance visit when the A/C was 5.5 YE. No sampling inspection was performed (non sampling A/C). In the new fleet, the A/C became part of the sampling fleet. The next sampling inspection for this A/C (6 YE / 6 YE sampling tasks) should be performed 6 YE after the last maintenance visit, therefore at the A/C age of 11.5 YE. Presumably, this would be the next 12 YE inspection event for this A/C, therefore the 12 YE sampling threshold inspection would be performed at this aircraft age, too.

NOTE: If an operator’s established sample fleet consists of only 1 aircraft, the next check containing sampling inspections (e.g. 6 YE inspection) should be performed on this aircraft before it is removed from the sample fleet and replaced by another one (change of status). This is to achieve inspection data which are representative for the specific environment / operation.

NOTE: If an aircraft is added to the fleet for a limited time it is advisable to review the sample fleet composition with special care. In particular, aircraft should not be removed from an established sample fleet in exchange for an aircraft being foreseeable in the fleet for a limited time only.

NOTE: Since every case is specific, an acceptable agreement should be sought with the operators' Airworthiness Authorities. The operator should contact AIRBUS if there are doubts how to apply the above rules for a particular case.

C. SAMPLING PROGRAM ILLUSTRATIONS

A chart presenting the way to deal with the sample/100% threshold and interval is shown below.

The Sampling Program aircraft should first be selected before the subsequent planning of the SSI details.

D. ED SAMPLING PROGRAM TERMINATION

The ED sampling program for a task may be terminated after completion of 18 YE sampling inspections of the dedicated task in all sampling fleet without significant corrosion findings and no significant changes on the operational conditions. Corrosion that exceeds Level 1 is considered significant (ref. §7.B.)

7. CORROSION PREVENTION AND CONTROL PROGRAM (CPCP)

A. INTRODUCTION

The Structures section includes requirements to control corrosion to Level 1 or better on all structural details, elements or assemblies which contribute significantly to carrying flight, ground, pressure or control loads, and whose failure could affect the structural integrity necessary for the safety of the aircraft.

All Corrosion Prevention and Control Program (CPCP) requirements are indicated by the code 'CPCP' in the "SOURCE" column.

Some calendar-time tasks are also covered by the Sampling Program, i.e. they have a Sample Threshold/Interval. For these tasks, the 100% Threshold is the time at which the task becomes a CPCP task.

B. CORROSION LEVEL DEFINITIONS

The definitions for the various Levels of corrosion are as follows:

Level 1 Corrosion

Damage occurring between successive inspections that is within allowable damage limits;

or

Damage occurring between successive inspections that does not require structural reinforcement, replacement or new damage tolerance based inspections;

or

Corrosion occurring between successive inspections that exceeds allowable limits but is local and can be attributed to an event not typical of operator usage of other aircraft in the same fleet (e.g. Mercury spill);

or

Light corrosion occurring repeatedly between inspections that eventually requires structural reinforcement, replacement or new damage tolerance based inspections.

Level 2 Corrosion

Any corrosion finding that exceeds Level 1, requiring review of the operator's CPCP effectiveness but that is not determined to be Level 3.

Level 3 Corrosion

Corrosion occurring during the first or subsequent accomplishments of a corrosion inspection task that the operator determines to be an urgent airworthiness concern.

C. CPCP RULES

The effectiveness of the Corrosion Prevention and Control Program is determined by following the General Rules applicable to the Structures section (refer to Paragraph 8) and the rules listed below (Refer also to CPCP Flow Chart and Decision Steps on following pages).

Level 1 Corrosion Findings

Should inspections consistently reveal corrosion Level 1 findings for a given area during repeat inspections on particular aircraft operated in similar conditions, then the existing task is considered effective for the concerned area, and no change to the program is necessary.

Level 2 Corrosion Findings

Should inspections reveal that corrosion is Level 2 for a given area during repeat inspections, then the existing task is not effective for the concerned area of the particular fleet.

In order to control corrosion to Level 1 or better, consideration should be given to one or more of the following corrective actions:

- Decreasing the inspection threshold/interval
- Considering a higher inspection level
- Reconsidering the Concept (Sampling or 100%)
- Application/More frequent application of Temporary Protection System
- Embodiment of preventive modifications, where applicable
- Installation of parts with improved protection standard, where applicable

In this way, the CPCP is self-regulating and will adjust itself to the optimum program.

Level 3 Corrosion Findings

Should inspections reveal that corrosion is Level 3 in a given area, then the existing task is not effective for the concerned area.

In addition to the considerations given for Level 2 corrosion, an action plan calling for a one time inspection of the concerned area should be expeditiously agreed with the local Aviation Authority and carried out on all aircraft of a similar age or older.

Airbus may be consulted to determine whether or not the airworthiness is affected. In this case all details of findings are to be promptly reported for detailed evaluation and the assistance required clearly expressed.

A periodic review of the Structures section, with particular attention to reported fleet data shall be scheduled to maintain the target of this program to control corrosion to Level 1 or better on all structural details, elements or assemblies which contribute significantly to carrying flight, ground, pressure or control loads, and whose failure could affect the structural integrity necessary for the safety of the aircraft.

Corrosion Findings Report

Depending on the Corrosion Finding Level the reporting requirements are as follows:

Corrosion Level	**Reporting to**	**Reporting requirement**
Corrosion (on non CPCP structures)	Regulator	Not required
	Airbus	Preferable, but not required, it is at Operator discretion
Level 1	Regulator	Not required
	Airbus	Preferable, but not required, it is at Operator discretion
Level 2	Regulator	Preferable, however requirement, disposition and procedure may vary, depending upon the responsible National Aviation Authority. (*)
	Airbus	
Level 3	Regulator	Required

	Airbus	Required

NOTE: Corrosion level reports and records are useful information and provide evidence to demonstrate the effectiveness of CPCP or justify an adjustment.

(*) Reporting to OEM for Level 2 corrosion may be required by AD or ALS in certain cases.

FLOW CHART TO DETERMINE CORROSION LEVELS

EXPLANATION ON FLOW CHART DECISION STEPS

DECISION STEP A - CORROSION FINDING

There is a corrosion finding which is considered to be more than a negligible finding.

DECISION STEP B - BEYOND ALLOWABLE LIMITS

The corrosion defect noticed on the considered aircraft is beyond the allowable limits as defined by the manufacturer (e.g. SRM, SB, etc.).

NOTE: Corrosion findings greater than Level 1 (regardless where and when the corrosion is detected) on structure related to a DT ALI shall be reported to Airbus.

DECISION STEP C - AIRWORTHINESS AFFECTED

The corrosion defect is beyond the allowable limits which prevents the aircraft from flying in a safe condition.

When significant corrosion findings occur which could affect the structural integrity of the airplane Airbus can be consulted to determine whether or not the airworthiness is affected. In this case all details of findings are to be promptly reported for detailed evaluation and the assistance required clearly expressed.

DECISION STEP D - DUE TO A NON TYPICAL EVENT

For the purpose of the flow chart, a non-typical event is an event which is considered to be not representative of the events which normally occurs or could occur in the concerned area.

As examples:

- mercury spillage
- corrosive fluid spillages when they are demonstrated to be exceptional, however when they are noticed to be systematic they cannot be considered as non-typical.

8. FATIGUE MONITORING PROGRAM

A. GENERAL

The Fatigue Monitoring Program (FMP) is defined to indicate unexpected early occurrence of fatigue related deterioration on metallic structure.

The FMP tasks are established for inspection in advance of the calculated 100% Fatigue Damage (ALS Part 2) inspection thresholds. The FMP tasks are expressed in calendar time to enable operators to plan task accomplishment within existing planned heavy maintenance checks (i.e. at 6 years multiples or equivalent operator's heavy maintenance event interval).

The process to establish the FMP has been discussed and accepted by the EASA certification and aircraft maintenance ranches.

The FMP is part of the Airbus Ageing Airplane monitoring process. FMP tasks selection, task reviews and adjustments of the global FMP are addressed in the Structure Task Group (STG) meetings.

The FMP allows operators to adjust or remove a FMP task from its Operator's Maintenance Program (OMP). This is based on confirmed nil findings/non-significant findings on a certain proportion of the operator's fleet. This could be done through Operator's Reliability Program.

FMP requirements are identified as "MRB FMP" in the MPD source column.

B. FMP Applicability

The FMP is a configuration based monitoring programme.

All aircraft within the operator's fleet in the structural configuration identified in the FMP task applicability are subject of the FMP requirement.

C. FMP Requirements Fulfilment

The aim of a FMP requirement is fulfilled in case at least 10 airplanes within one operator's fleet (or from different operators belonging to the same airlines group, managed by the same maintenance organization and with identical FMP task content on all OMP) have accomplished the FMP task at the inspection threshold and reported (see paragraph "FMP Tasks Reporting").

Once FMP requirement is fulfilled, the FMP task may be adjusted or deleted from the Operator's Maintenance Program (OMP), depending on the FMP task type (see paragraph "FMP Task Type").

Credit cannot be taken from previous accomplishment of FMP tasks by other operator unless managed under the same maintenance organization.

Credit can be taken from previous accomplishment of the former related Fatigue Sampling tasks as long as they were managed by the same maintenance organization at any of the previous heavy maintenance checks of the airplane.

Alternatively, operators may accomplish FMP tasks on all aircraft subject of FMP task applicability in their fleet and update their OMP based on the global adjustment of the FMP inspection task. This is performed during STG meetings and provided in the MRBR Appendix 11 (FMP).

D. FMP Tasks Type

There are two types of FMP tasks depending on whether there is an existing associated 100% fatigue requirement (ALS Part 2) or not:

- FMP tasks without associated ALS Part 2 (NOTE A FMP tasks)
- FMP tasks with associated ALS Part 2 (NOTE B FMP tasks)

(1) FMP tasks without associated ALS Part 2 (NOTE A FMP tasks)
FMP tasks without an associated ALS Part 2 task are designated as NOTE A FMP tasks.

NOTE A FMP tasks provide a threshold (in Calendar Time) and a repeat interval at 6 YE.

NOTE A FMP tasks are subject for threshold adjustment in OMP based on its inspection results:

- In case a minimum of 10 aircraft have been inspected at the NOTE A FMP task threshold Airbus should be informed about all inspection results (see paragraph "FMP Tasks Reporting").
- Airbus will acknowledge receipt of the inspection result via Tech Request.
- The operator may increase the NOTE A FMP task threshold by 6 YE (or the equivalent operator's heavy maintenance interval) in its OMP.
- The adjusted NOTE A FMP task threshold is applicable for the individual operator even in case the fleet is renewed.
  Example:
  An operator accomplished a NOTE A FMP inspection on 10 MSN with NIL findings, reported the inspection results to Airbus and increased the NOTE A FMP task threshold from 18 YE to 24 YE. At an aircraft age of 22 YE the operator renews its fleet and adds new aircraft with the same configuration as the one subject for the NOTE A FMP task. The NOTE A FMP task threshold remains at 24 YE in the OMP, so the operator can take benefit from previously accomplished inspections.

Operators with a fleet of less than 10 aircraft as per NOTE A FMP task applicability may also report nil-finding/non-significant findings task accomplishments to Airbus. This data will be used to support global NOTE A FMP tasks adjustment /deletion during periodic STG meetings.

(2) FMP tasks with associated ALS Part 2 (NOTE B FMP tasks)
FMP tasks with an associated ALS Part 2 task are designated as NOTE B FMP tasks.

The associated ALS Part 2 task can be identified by the same task numbering string except from the 8th task digit. Example: ALS Part 2 task 572150-01-2 is the associated one for the NOTE B FMP task 572150-09-2.(see MRBR paragraph 7.2 for cross reference list among NOTE B FMP tasks and associated ALS Part 2 tasks).

NOTE B FMP tasks provide a threshold (in Calendar Time) to be accomplished in advance of the associated 100% fatigue requirement (ALS Part 2).

NOTE B FMP tasks are subject for deletion in OMP based on its inspection results:

- In case a minimum of 10 aircraft have been inspected at the NOTE B FMP task threshold Airbus should be informed about all inspection results (see paragraph "FMP Tasks Reporting").
- Airbus will acknowledge receipt of the inspection result via Tech Request.
- The operator may delete the NOTE B FMP task from its OMP.
  Example:
  An operator has more than 10 A/C in line with the applicability of an FMP task provided. After accomplishment of 10 inspections in advance of the associated ALS Part 2 FC/FH inspection requirement the results should be reported to Airbus. Airbus will acknowledge receipt of the report and the operator can terminate this NOTE B FMP task from its maintenance program.

Operators with a fleet of less than 10 aircraft as per NOTE B FMP task applicability may also report nil-finding/non-significant findings task accomplishments to Airbus. This data will be used to support global NOTE B FMP tasks evolution/deletion in the FMP task reviews during periodic STG meetings.

Rules to apply for a NOTE B FMP task and its associated 100% fatigue requirement (ALS Part 2):

1.

In case the NOTE B FMP task and its associated 100% fatigue requirement (ALS Part 2) have the same inspection procedure, it is up to operator's choice to decide whether to count the NOTE B FMP task accomplishment as the ALS Part 2 Threshold inspection.

Above statement is not applicable in case the NOTE B FMP task and its associated 100% fatigue requirement (ALS Part 2) have a different inspection procedure.

2.

If an airplane reaches the FC or FH of the associated 100% fatigue requirement (ALS Part 2) threshold in advance of the NOTE B FMP task threshold then the 100% fatigue requirement has to be followed (ALS threshold FC or FH, whichever occurs first) and the NOTE B FMP task applicability may be updated to exclude the very airplane from the OMP.

E. FMP Tasks Reporting

FMP tasks are subject for review based on operator's feedback of FMP tasks accomplishment.

(Refer to MRBR Appendix 6 for reporting system).

Reporting is key for FMP global adjustment and efficiency.

Minimum data that the report should contain:

- MSN
- Inspection date
- FC and FH
- Inspection result (Findings/nil findings)
- In case of findings: Damage description

9. GENERAL RULES APPLICABLE TO THE STRUCTURE SECTION

A. The Maintenance tasks are to be carried out "at or before" the limits stated for Sample Threshold/Interval and 100% Threshold/Interval.

B. The Threshold is the time at which the first maintenance task is due:
   - For tasks in FC or FH, the Sample Thresholds and 100% Thresholds are counted from first flight,
   - For tasks in Years, the Sample Thresholds and 100% Thresholds are counted from date of initial delivery from manufacturer, unless otherwise stated.

C. For repeat maintenance tasks, the interval starts at the time of the last maintenance task performed.

D. The thresholds and intervals quoted in calendar time in this section include aircraft time in and out of service. In other words, operators will not, in general, be allowed to take credit for time out of service or storage periods to extend corrosion inspection intervals.

E. It is assumed that the structure to be inspected is in a state of cleanliness which shall allow a satisfactory inspection at the required inspection level.

   Where existing Temporary Protection (TPS) permits clear assessment of the condition of the structure, the Temporary Protection may remain in place for the inspection.

F. If damage is found or suspected (such as bulging skin) then the full extent of any damage must be clearly identified using appropriate inspection techniques and/or disassembly when necessary. This may require additional access to that stated for the maintenance task.

   All damage is to be evaluated and repaired in accordance with documentation acceptable to the relevant Airworthiness Authority.

G. If inspections indicate evidence of deterioration, appropriate further actions must be taken to prevent similar deteriorations from occurring in the operators fleet.

   For corrosion findings refer to CORROSION PREVENTION AND CONTROL PROGRAM in this section.

   Operators shall report inspection results related to SSIs to the manufacturer through the Maintenance Task Reporting System.

   Please refer to AirbusWorld > Content library > Maintenance and Engineering > Template. This then gives access to the appropriate reporting spreadsheet.

   Analysis of the reported data will enable Airbus to monitor the effectiveness of the Maintenance Program and to further optimize it. Airlines who report data will also have the possibility to benchmark task findings statistics against the reported data of other Airlines.

   Associated guideline can be found under: Airbus World > App catalogue > IDOLS for Scheduled Maintenance > Support > MPD Task Reporting Guidelines

   Note: This requirement does not take precedence over existing national requirements for occurrence reporting.

H. Ensure that all drain holes and drainage paths are clear from obstruction.

I. The following applies to Temporary Protection System (TPS) application:
   1. Prior to application of TPS, perform an inspection of the area at the inspection level for the task quoted in calendar time.
   2. For those items/areas where TPS application is quoted in the TPS column, the integrity of the existing TPS is to be checked to determine if additional application is required, which will be done on an “as necessary” basis. If cleaning has been done (with solvents, or alkaline cleaners, or high

pressure water and solvent, or steam and solvent), TPS must be reapplied. If TPS film is locally damaged, TPS must be removed then must be reapplied on these TPS-damaged areas.

3. The Type and Grade of TPS to be applied is provided in the TPS column of the Structures Program. Alternative Types and Grades may be used, where applicable.
4. When TPS is only applied to a selected item/area within a task boundary, details are provided as a note in the Task Description column.
5. Sampling Program tasks do not have TPS selected in the MRB Report Structure Program. If an operator chooses to apply TPS to a particular item/area for aircraft inspected in accordance with the Sampling Program, these aircraft are no longer representative of the non-sampled aircraft. In this case, TPS must be applied to all aircraft in this area, including the aircraft not selected for sampling. This task then effectively becomes 100% for those specific aircraft.
6. When TPS application is not allowed on complete area/item, this is highlighted in the TPS column.

DO NOT APPLY TEMPORARY PROTECTIONS ON OXYGEN SYSTEMS, CONTROL CABLES, PULLEYS, INSULATION BLANKETS, ELECTRICAL WIRING, SELF-LUBRICATED BEARINGS AND LUBRICATED SURFACES. DRAIN VALVES AND ALL OPEN ORIFICES ARE TO BE PROTECTED FROM INGRESS PRIOR TO TEMPORARY PROTECTION BEING APPLIED.

J. The access column may contain one of the following instructions concerning insulation blankets:

Insulation = Insulation to be removed from the inspection area.

Note 1 = Insulation to be displaced as required to complete the required maintenance task.

Ensure wet insulation blankets are dried prior to reinstallation, or replaced with new.

K. The requirements quoted in years have been established by assuming aircraft operation in a "typical" environment. Operators who routinely deviate from operation in a "typical" environment e.g. by transporting seafood products, should make appropriate adjustments to their program.

L. Inspection intervals recommended for surveillance of deterioration caused by the environment in fuel tank area (microbiological corrosion) should be adjusted by individual operators, considering their own in-service experience and operational environment.

M. Based on reports made through the Maintenance Task Reporting System, please refer to AirbusWorld > Content library > Maintenance and Engineering > Template this then gives access to the appropriate reporting spreadsheet for reporting, AIRBUS will:

– Inform all operators of any significant discrepancies discovered on the A320 FAMILY Fleet.
– Make the appropriate recommendations.

N. Additional information concerning SSI inspections is provided in AIRBUS supporting publications for the A320 FAMILY aircraft:

– Aircraft Maintenance Manual (AMM)
– Non-Destructive Testing Manual (NTM)
– Structure Repair Manual (SRM)
– Consumable Material List (CML)

O. All Tasks with "CPCP" quoted in the Source column are to be considered as CPCP Tasks.

P. The condition of the paint system should be verified during the inspections. Re-protection should be applied where necessary.

Q. “Touch and Go” Flight Cycles can be neglected if they are less than 5% of the total number of Flight Cycles up to threshold inspection or between two consecutive inspections.

Each “Touch and Go” cycle above 5% is to be counted as one Flight Cycle, up to threshold inspection or between two consecutive inspections.

R. In case of insulation being fitted in the inspection area, it is specified on a task by basis whether the insulation has to be displaced or to be removed to perform the inspection properly. For tasks transferred to ZIP, displacement of insulation is considered adequate.

S. Alternative inspection methods

Occasionally, structures tasks list alternative inspection method for an item. In case the inspection requirements differ between the alternative inspections method (GVI, DET, SDI), the following rule applies:

- When changing from a short interval inspection level (e.g. DET) to a high interval inspection level (e.g. SDI), the initial inspection of the new method (SDI) has to be accomplished at the old inspection method due date.
- Once this was accomplished, the new (higher) inspection method interval can be used. This is to ensure that no damage detectable with the new inspection procedure (SDI) is present in the inspection area.
- In case the inspection method is changed from an inspection with a higher interval (e.g. SDI) to an inspection with a lower interval (e.g. DET), no additional action is needed. The lower interval can be applied immediately.

ZONAL

1. GENERAL

This section provides the General Visual Inspection (GVI) requirements for each aircraft zone to inspect system and powerplant installations for security and general condition, structure for general condition and Electrical wiring installation for general condition. Inspections are to be accomplished at or before the stated intervals.

Inspections are to be accomplished on each aircraft at or before the stated intervals.

The inspections are specified by quoting the relevant zone number, zone description, access requirements and intervals.

All intervals for zonal task are defined in calendar time.

The extent of the inspection is defined by the preparation and access requirements.

The zone is to be inspected as visible with the relevant access open.

There are zones which will require more than one inspection at different intervals, because the depth at which the zone is to be examined may necessitate differing levels of accessibility.

The Zonal tasks must also inspect the general condition of any fairings, panels, or other items which are removed/opened to gain access to a particular zone.

The inspection tasks do not provide a complete summary of all items to be inspected in the affected zone. It is therefore considered that the person performing the inspection has an adequate knowledge of aircraft construction and of its system and wiring installation.

2. GUIDANCE FOR ACCOMPLISHMENT OF A ZONAL GVI

A Zonal GVI requires a visual examination to detect obvious unsatisfactory conditions and discrepancies. It shall be performed from within touching distance unless otherwise noted, that being the distance from the examiner's eye to the area/item being inspected.

Flashlights and mirrors may be required to provide an adequate view of all surfaces.

There is no requirement for equipment removal or displacement unless this is specifically called for in the access instructions. However, should unsatisfactory conditions be suspected, additional items may need to be removed or displaced in order to permit proper assessment.

Paint and/or sealant removal is not necessary and should be avoided unless condition is suspect.

It is expected that the area to be inspected is clean enough to minimize the possibility that accumulated dirt or grease might hide unsatisfactory conditions that would otherwise be obvious. Any cleaning that is considered necessary should be performed in accordance with approved procedures in order to minimize the possibility of the cleaning process itself introducing anomalies.

In general, the person performing the inspection is expected to identify degradation due to wear, vibration, moisture, contamination, excessive heat, aging, etc. and make an assessment as to what actions are appropriate to address the noted discrepancy. In making this assessment, the person performing the inspection shall take into account potential influence on adjacent system installations, particularly if these include wiring.

Zonal inspection tasks are required to support compliance to EWIS requirements. An individual "(EWIS)" marker is given after the task description to highlight this as appropriate.

The following list is intended to clarify the type of deterioration that constitutes a discrepancy that is expected to be found and corrected. The list is not intended to be exhaustive and may be amended or expanded as considered appropriate.

Structural Items/Assemblies

General

- Deformations e. g. bulging skin joint
- Corrosion
- Cracks
- Delamination or disbanding
- Obstructed drain holes
- Damage to hinges or latches
- Evidence of fluid spillage or pooled liquids

Accidental Damage

- Dents
- Impact marks
- Scratches or gouges
- Evidence of hail damage
- Evidence of lightning strike
- Evidence of foreign object damage (FOD) / bird strike

Fasteners

- General condition of fasteners
- Missing or broken fasteners

Surface Protection

- Damaged, detached or missing sealant
- Damaged, blistering or missing paint
- Severely discolored paint (evidence of corrosive fluid spillage)
- Accumulation of contaminants (dirt, grease, skydrol etc.)

Repairs

- Deterioration of previous repairs

Electrical installation

(also refer to AMM Chapter 20 Standard Practices)

Wire / Wire Harnesses

- Wire bundle/wire bundle or wire bundle/structure contact/chafing
- Wire bundle sagging or badly secured
- Wires damaged (large scale damage due to mechanical impact, overheat, localized chafing etc.)
- Lacing tape and/or ties missing/incorrectly installed
- Wiring protection sheath/conduit deformity or incorrectly installed
- End of sheath rubbing on end attachment device
- Grommet missing or damaged
- Dust and lint accumulation
- Surface contamination by metal shavings / swarf
- Contamination by liquids
- Deterioration of previous repairs

Connectors

- External corrosion on receptacles
- Backshell tail broken
- Rubber pad or packing on backshell missing
- No backshell wire securing device
- Fool proofing chain broken
- Missing or broken safety wire
- Discoloration/evidence of overheat on terminal lugs/blocks
- Torque stripe misalignment

Switches

- Rear protection cap damaged

Ground Points

- Corrosion

Bonding braid/bonding jumper

- Braid broken or disconnected
- Multiple strands corroded
- Multiple strands broken

Wiring clamps or brackets

- Corroded
- Broken/missing
- Bent or twisted
- Faulty attachment (bad attachment or fastener missing)
- Unstuck/detached
- Protection/cushion damaged

Supports (rails or tubes/conduit)

- Broken
- Deformed
- Fastener missing
- Missing edge protection on rims of feed through holes
- Racetrack cushion damaged

The following item could be considered to be covered by the ZIP if access to the electrical power center, relay boxes etc. are added in the access requirements:

Circuit breakers, contactors or relays

- Signs of overheat

Hydraulic/Fuel/Water Waste/Oxygen/Fire Detection/Fire Suppression system installation

- Seepage/leakage of liquid
- Broken or incorrect wire locking
- Pipes badly secured
- Pipe/pipe or pipe/structure contact (check for chafing and restore separation)
- Missing or broken clamps
- Crushed / damaged pipes
- Broken/disconnected bonding leads / jumpers
- Deterioration of previous repairs
- Obstruction of smoke detectors
- Plugged or damaged distribution nozzles

Air systems installation

- Evidence of leakage on adjacent structure/components
- Crushed/split ducts
- Misaligned, missing or broken clamps
- Ducting badly secured

Mechanical systems installation

- Bent/crushed control rods
- Sagging control cables
- Excessively worn, frayed or kinked control cables
- Excessively worn fairleads
- Extruded bearing liners
- Broken or incorrect wire locking
- Significant corrosion on cables, threads

Cargo Systems

- Damaged/holed compartment liners
- Seal damage
- Excessively worn PDU rollers (sign of jamming and resultant overheat)
- Missing/damaged stops/latches
- Missing/damaged transport roller and ball transport units
- Damaged cargo net restraining attachments
- Roller track corrosion

Engines/Pylons

- Blade damage (e.g., nicks, cracks)
- Blades rub (on rubstrip)

- Vane damage
- Cowling damage
- Loose or migrating fasteners and bushings (due to vibration)
- Discoloration (due to heat damage)
- Foreign Object Damage (FOD)
- Damage due to birdstrike/ingestions

General

- Illegible labels
- Condensation in windows
- Window crazing
- Oil canning

3. NOTES

NOTE 1 and 3 : Contents of MRBR Section E Notes are given as full text to the appropriate tasks in the MPD.

4. REPORTING SYSTEM

As a result of the CPCP requirement to control corrosion to Level 1 or better (Refer to Structure Section), operators shall report corrosion findings to the manufacturer in accordance with the Maintenance Task Reporting System.

Please refer to AirbusWorld > Content library > Maintenance and Engineering > Template. This then gives access to the appropriate reporting spreadsheet.

Analysis of the reported data will enable Airbus to monitor the effectiveness of the Maintenance Program and to further optimize it. Airlines who report data will also have the possibility to benchmark task findings statistics against the reported data of other Airlines.

Associated guideline can be found under: Airbus World > App catalogue > IDOLS for Scheduled Maintenance > Support > MPD Task Reporting Guidelines

Note: This requirement does not take precedence over existing national requirements for occurrence reporting.

APPENDIX 2 — CROSS REFERENCE LIST

1. GENERAL

This section includes a cross-reference between the tasks contained in the current revision of the A320 FAMILY MPD and the various related MPD Source Documents or Source tasks, as presented hereafter.

2. METHOD OF PRESENTATION (The data is only available in PDF and XLS format)

A. Modifications (MOD) - Cross Reference List

MOD	MOD-SB	PRE MOD.		POST MOD.	
		TASK NUMBER	SECTION	TASK NUMBER	SECTION

The Service Bulletin number is quoted only if the modification can be retrofitted by the operator.

B. MRB Report-Cross Reference List

This subsection gives the appropriate cross reference between requirements in MRB Report and corresponding tasks in MPD.

MRB TASK REFERENCE	MPD TASK NUMBER	AMTOSS REFERENCE	MPD APPLICABILITY

C. Airworthiness Limitation Item (ALI) - Cross Reference List

This subsection gives the appropriate cross reference between requirements in ALI and corresponding tasks in MPD.

ALI TASK REFERENCE	MPD TASK NUMBER	AMTOSS REFERENCE	MPD APPLICABILITY

D. Certification Maintenance Requirements (CMR) - Cross Reference List

CMR TASK REFERENCE	MPD TASK NUMBER	AMTOSS REFERENCE	MPD APPLICABILITY

E. System Equipment Maintenance Requirements (SEMR) - Cross Reference List

SEMR TASK REFERENCE	MPD TASK NUMBER	AMTOSS REFERENCE	MPD APPLICABILITY

F. Fuel Airworthiness Limitations (FAL) - Cross Reference List

FAL TASK REFERENCE	MPD TASK NUMBER	AMTOSS REFERENCE	MPD APPLICABILITY

G. ETOPS Configuration, Maintenance and Procedures (CMP) - Cross Reference List

CMP TASK REFERENCE	MPD TASK NUMBER	AMTOSS REFERENCE	MPD APPLICABILITY

APPENDIX 2-1

APPENDIX 3 — CUSTOMIZABLE EQUIPMENT

1. GENERAL

In accordance with MSG3 policy, available Vendor Recommendations are considered and discussed in the Maintenance Working Group meetings and accepted only if they are applicable and effective according to MSG-3 criteria. The purpose of this appendix is to provide the intervals selected by the Maintenance Working Groups for the part numbers considered.

A320FAM tasks having an interval quoted as CE are valid for equipment part numbers that have been certified by Airbus for installation on the A320FAM aircraft. For those tasks that quote CE in the interval column, MRBR Appendix 10 identifies intervals specific to these equipment part numbers. This appendix does not address equipment part numbers that have been installed by an operator under a locally approved design change or an STC. The impact of such changes on the maintenance program is under the responsibility of the Operator and their local Airworthiness Authority.

For those items certified by Airbus for installation on the A320FAM aircraft, the Vendor Recommendations have been duly considered and reviewed by joint Operator/Airbus Maintenance Working Groups, and appropriate tasks and intervals selected in accordance with MSG3 applicability and effectiveness criteria. In case of conflicting requirements between Vendor Recommendation(s) and MWG decisions reflected in the MRB Report, then the MRBR tasks and interval(s) takes precedence.

Changes to Vendor Recommendations, or new Vendor Recommendations associated with items recently certified by Airbus for installation on A320FAM, may not be yet reflected in this appendix. These will be addressed through the MRB Process whereby Airbus will identify the necessary revisions to the MSG3 analysis for subsequent updating of the MRB Report.

2. DATA DESCRIPTION

The following data is provided:

1. REV CODE
   "R" for revised
   "N" for new
   "D" for deleted
2. MPD TASK NUMBER
   MPD task number
3. DESIGNATION
   Component functional designation
4. MANUFACTURER / VENDOR FSCM
   Reference to the manufacturer/vendor FSCM code. This code is in line with the AIRBUS Vendor Information Manual (VIM).
5. PARTNUMBER
   Component part number in line with the Airbus - or the Vendor Part Numbering System. The character "X" is used to denote any digit.
6. INTERVAL
   Interval selected by the Maintenance Working Group and validated by the A320FAM Industry Steering Committee.

APPENDIX 4 — AIRPL@N EXAMPLES

1. INTRODUCTION

The AirPl@n Simulator features a customized graphic view of aircraft maintenance time, based on the MPD Manhours.

This maintenance planning simulation can be customized by the following criteria:

- A/C Series
- Engine Type
- A/C Utilisation
- Maintenance Concept (Block, Equalized)

The AirPl@n Simulator is available on the Maintenance & Engineering platform of www.airbusworld.com.

AirbusWorld/Maintenance_and_Engineering/Prepare_Maintenance_Planning/AirPl@n_Simulator

NOTE: For questions regarding this new service please turn to: airplan@airbus.com

APPENDIX 6 — MANHOUR TABLES

1. ACCESS PANEL MANHOURS

The following table provides the manhours for opening and closing of access panels. Either removal / installation or opening / closing manhours (MH) of access panels are reflected, depending on the panel type.

The manhours are expressed in hours and their decimal fractions. Where “TBD” is quoted, the manhours are still to be developed by Airbus.
